CURRENT INDUSTRIAL REPORTS
M3-1(97)

Acknowledgments

This report was prepared under the general direction of **Stephen Andrews**, Assistant Division Chief for Economic Indicator Programs. Within the Manufactures and Construction Division, the preparation of this report was performed under the supervision of **Kathleen Menth**, Chief, Manufacturers' Shipments, Inventories, and Orders Branch, assisted by **Lee Wentela** and **Derrick Roy.** Other contributing analysts include **Clarissa Edwards, Anthony Figlioli, Joe Haurand, Doris Kling, Catherine Knudsen, Sandra Sollinger, Tempie Whittington**, **Jessica Young**, **Alice Miller, Korrey Blount,** and **Marvella Hicks.** The assistance of **Frances Porter** is also appreciated.

Lillie M. Skinner coordinated the various phases of the publication process assisted by **Enid Winters** and **Dorothy Heaton**.

The electronic computer programs were developed under the direction of **Frances Bush,** Chief, Current Manufactures Branch, assisted by **Alan Bolin**.

The staff of Administrative and Customer Services Division, **Walter C. Odom**, Chief, performed publication planning, design, composition, editorial review, and printing planning and procurement. **Cynthia G. Brooks** coordinated and edited the publication.

Finally, a special acknowledgment is due to the many businesses whose cooperation was essential to the success of this report.

Summary of Revisions

GENERAL

The revisions to the historical data from the Manufacturers' Shipments, Inventories, and Orders survey, as shown in this publication, are the result of:

- Benchmarking the shipments and inventory data to the 1996 Annual Survey of Manufactures (ASM).
- Adjusting new and unfilled orders to be consistent with the benchmarked shipments and inventory data.
- Correcting monthly data for late receipts, reclassification of reported data, and revisions to previously reported data.
- Updating the trading day adjustment factors for the shipments series.
- Updating the seasonal adjustment factors for all series.

Table A summarizes the results of the first two procedures for 1995 through 1997 in the form of annual level and year-to-year percent change revisions. Table B shows the revisions attributable to late or revised data, and trading day and seasonal adjustment factor updates as they affected the more recent month-to-month trends in the seasonally adjusted data.

SPECIFIC

Appendix F includes a discussion of the trading day adjustment methodology and an updated set of daily weights for each shipments series. The tables in appendix G provide updated diagnostic information on the characteristics and quality of the seasonal adjustment for all series. Table B indicates the effects of updating the trading day and seasonal adjustment factors, as well as correcting the monthly data for late or revised data reports, on the month-to-month percent changes for 1997 for the aggregates and major industrial categories.

DATA AVAILABILITY

In addition to this report, historical data from 1958 through 1997 are available on the Internet at http://www.census.gov/ftp/pub/indicator/www/m3/index.htm.

The monthly press releases for the M3 survey are issued around the 18th working day of the month following the statistical period for the advance report on durable goods and the 23rd working day for the full report. These are available in hard copy or by a fax transmission service, both on a subscription fee basis. To subscribe to this service, call 301-457-4843. These reports are also available the day of issue through the Department of Commerce's online Economic Bulletin Board (N-8-1) (202-482-3870).

Description of Survey

The Manufacturers' Shipments, Inventories, and Orders (M3) survey provides broad-based, monthly statistical data on economic conditions in the domestic manufacturing sector. The survey measures current industrial activity and provides an indication of future business trends. Data are used by the Executive Branch of the Government for developing economic, fiscal, and monetary policy; the Bureau of Economic Analysis as components of the gross domestic product estimates; and trade associations, corporate economists, and other members of the business community as an analytical tool for assessing the current and future economic condition of the country.

COMPOSITION OF INDUSTRY CATEGORIES

There are 80 separately tabulated industry categories in the M3 survey. These categories are groupings of the 459 manufacturing industries as defined in the *1987 Standard Industrial Classification (SIC) Manual*.[1] Appendix B lists these categories.

Because companies provide data on a voluntary basis, reporting in many of these 80 categories is not sufficient to warrant separate publication of the data. Consolidated reporting by some large companies also limits the quality of the data in some categories. A company which reports on a consolidated basis (entire company or a division) is included in the M3 category in which the reporting unit as a whole is classified and has no influence on the movement of the other industries which may be included in its combined report.

As a result, it has been necessary to combine the 80 industry categories into 45 publication levels for shipments and total inventories. For new and unfilled orders and inventories by stage of fabrication, it has been necessary to introduce further combinations because of the lower response rates for those items.

COMPOSITION OF THE SURVEY PANEL

The monthly M3 estimates are based on information obtained from most manufacturing companies with $500 million or more in annual shipments. In order to strengthen the sample coverage in individual industry categories, the survey includes selected smaller companies. The sources of the companies for the survey are the quinquennial censuses of manufactures and the annual surveys of manufactures in the interim years.

For firms that operate in a single M3 industry category, the reporting unit typically comprises all operations of the company. Most large, diversified companies, however, file separate reports for divisions with significant activity in different industrial areas.

The composition of each company or reporting unit of a company in the survey usually includes more than one plant or establishment and frequently includes industry activities outside the M3 category in which it is classified. The survey methodology described later in this chapter assumes that the month-to-month changes of the total operations of the reporting units classified in each industry category effectively represent the month-to-month movements of all establishments which make up the category.

In 1962, the initially selected sample for this survey included all companies with more than 1,000 employees and smaller companies selected with probabilities proportional to their employment size within each industry category. As there was some deterioration in response rates for companies with between 100 and 1,000 employees, in January 1975, the staff selected a supplemental sample of approximately 1,000 companies from the universe of companies in this size range in order to strengthen the estimates. Although the response rate was only about 60 percent for this group, beginning in January 1978 these data were added to the panel and included in the calculations of the monthly estimates. Because of poor response rates, the survey no longer included companies with less than 100 employees; instead, data for these companies were estimated by using overall industry month-to-month movements based on data reported by the larger companies.

In recent years, the size of the value of shipments of the company or reporting unit rather than the employment size has influenced the selection of companies to increase response rates. Using this criterion, census staff visit or otherwise contact large companies that did not report in the survey to request their participation or reconsideration of a previous decision not to participate. Also, staff request large diversified reporting companies to provide additional industry categories not previously provided.

Another method used for improving response has been contacting nonreporting companies by letter. Staff send letters on an ongoing basis to companies in industry

[1] *Standard Industrial Classification Manual: 1987.* For sale by Superintendent of Documents, U.S. Government Printing Office, Washington, DC. Stock No. 041-001-00314-2.

categories with low response rates. In 1990, staff selected a probability sample and mailed requests to about 400 midsize companies in the plastics industry. The purpose was to test the viability of probability sampling, especially in industries comprised primarily of smaller, less diversified companies.

As a result of these efforts, we increased response by adding about 45 to 55 percent of the companies contacted to the panel. However, respondent dropouts frequently offset these increases. The current coverage levels in the survey show that reported data represent approximately 55 percent of the shipments estimates at the total manufacturing level, while the individual coverage rates for the 20 two-digit major SIC industries vary from about 20 to 99 percent.

LIMITATIONS OF THE DATA

The monthly data presented in this publication are subject to both sampling and nonsampling errors. Sampling errors occur because reports are received from a sample rather than from the complete universe of manufacturing companies. Because the present composition of the panel is not based on a probability sample, the amount of sampling error cannot be quantified. Nonsampling errors, on the other hand, are attributable to many sources. The use of company or divisional reports to estimate the monthly change for establishments is one source of nonsampling error. The use primarily of large companies to represent the month-to-month movement of all companies is another potential source. In addition, response and processing errors may be present, although computer edits and analytical review of the data detect the most significant errors of this kind prior to tabulation.

MONTHLY ESTIMATION PROCEDURE

A link relative procedure derives the monthly universe estimates of shipments, unfilled orders, and total inventories for each industry category. The universe estimate for the previous month is multiplied by the monthly ratio of change tabulated for reporting companies in the current month to arrive at a universe estimate for current month.

When an individual company reports unusually large changes from the previous month, or when a particular company has unique data patterns differing substantially from the movement shown by the rest of the reporting panel in a particular industry category, the company is excluded from the ratio of change calculation but included in the universe estimate of level. The effect of this procedure is to restrict the estimation for nonrespondents and firms not in the survey panel to the general trend of the industry.

The universe estimate of new orders is derived from the monthly estimate of shipments plus the change in unfilled orders between the current and prior period. The estimate includes orders that are received and filled in the same month as well as orders that have not yet been filled. It also includes the effects of cancellations and modifications of previously reported orders.

The standard ratio estimate procedure is not followed for new orders because not all companies report new orders, and some that do report this item limit their reporting to specific products for which long lead times are required in the production cycle. These companies, in effect, exclude new orders received for products that are shipped from inventory.

A modified procedure also is used to estimate the stage of fabrication inventory data. In this procedure, the total inventory data estimated for each tabulated industry category are retabulated to the appropriate two-digit SIC major group levels and serve as control totals for the stage of fabrication data. Initial estimates are made for each of the stages of fabrication at the two-digit SIC level using the ratio estimation procedure. The differences between the sum of the stage of fabrication detail and total inventories at the two-digit SIC level are then allocated proportionally to the stage of fabrication figures to form the estimates. The reasoning behind this procedure is that a significant number of companies report total inventories but cannot report inventories by stage of fabrication.

Trading Day Adjustment

Variations in the rate of manufacturing activity resulting from different numbers of trading days in the same month for different years and variations in the length of months can be an important cause of month-to-month fluctuations in the shipments data. For many industries, these irregularities can be identified approximately and removed so that the underlying trend cycle stands out clearly.

Recent software and data processing improvements have facilitated research and implementation of unique trading day adjustment factors for each series. These improvements include refinements to the trading day analysis in the X-12 seasonal adjustment program[2], additions to diagnostic software[3] that identifies progressively unstable data patterns, and redesign of the monthly survey data processing system.

Most of the shipments series have trading day factors calculated in the trading day regression analysis routine of the X-12 software. The adjustment of 1987 to 1992 shipments used these new factors. Table F–1 of M3-1(90) shows the factors used before 1987. However, eight of the shipment series did not have identifiable trading day patterns and are only being adjusted for length of month

[2]The X-12 ARIMA Seasonal Adjustment is the program used to calculate trading day weights and to seasonally adjust data in this publication.

[3]"Sliding Spans Diagnostics for Seasonal and Related Adjustments," Findley, Monsell, and Shulman, Bureau of the Census, Washington, DC. 1986.

variations. Appendix F comprises the set of daily weights for each shipments series and a more detailed discussion of the methodology.

Seasonal Adjustment Methodology

The monthly data are adjusted for seasonality at the most detailed level tabulated in the survey, using the X-12 ARIMA version of the Census Bureau's seasonal adjustment program.[4] The seasonally adjusted estimates for shipments, unfilled orders, and total inventories for M3 industry categories are calculated by dividing the unadjusted estimates by seasonal adjustment factors computed by the X-12 ARIMA seasonal adjustment program. Seasonally adjusted new orders are computed by adding the changes between current and prior period seasonally adjusted unfilled orders to the current month's seasonally adjusted shipments.

The inventory by stage of fabrication data are seasonally adjusted at the two-digit SIC major group level for each stage. If the sum of the adjusted stage of fabrication does not equal the major group totals resulting from summing the seasonally adjusted total inventories for the individual industries, the difference is proportionally allocated to the stage of fabrication detail.

Staff calculate seasonal factors concurrently and include the current period observation in the calculation of the seasonal factor for that month. The factors reflected in this report are based on using data from January 1982 through December 1995 for shipments, unfilled orders, and inventories. Appendix G shows reliability measures regarding the adequacy of the seasonal adjustment of specific series. For information on specific measures used in the seasonal adjustment analysis, selection of options within the X-12 program for the individual industry series, and tests for the presence of seasonality, contact the Manufacturing and Construction Division, U.S. Census Bureau, Washington, DC 20233, or call 301-457-4749.

BENCHMARK PROCEDURE

The M3 survey data are benchmarked to reduce both sampling and nonsampling errors. The relatively small monthly sample size as well as the differences that result from collecting the monthly data on a divisional basis as compared to the benchmark data on an establishment basis account for most of the revision. Also, some monthly reports received too late to be included in the monthly publications are added to improve the revised estimates of change of the historical monthly data.

The benchmarking process for this report included comparing monthly data reported by large companies with their annual data submitted in the 1996 Annual Survey of Manufactures (ASM).

Estimates of annual shipments and end-of-year total and stage of fabrication inventories calculated in the monthly survey were benchmarked directly to the data compiled in the quinquennial censuses of manufactures and the interim ASM's. Beginning with the 1995 benchmark, we introduced a slight deviation in our procedure for the inventory benchmark. In benchmarks prior to 1995, the constraints were the end of year inventory levels except in census years when beginning and ending census year levels were used. This remains the procedure with the exception of the first year of a new ASM sample, which occurs every 5 years (in the years ending in 4 and 9). For those years, the beginning year inventory will be the constraint rather than the last year of the old sample's ending inventory. Based on the new procedure, the 1993 benchmark level included in this publication is the 1994 ASM beginning year inventory. The benchmarking also included adjusting the monthly data to the drift adjusted 1988-1991 Annual Survey of Manufactures. An explanation of this is included on page X in the M3-1(96) Manufacturers' Shipments, Inventories, and Orders: 1987-1996 . The unfilled orders levels were adjusted based on changes in the ratio of unfilled orders to shipments of companies reporting in the monthly survey and the ratio of the ASM shipments estimate to the summed monthly survey data. Since new orders are defined as the change in unfilled orders between the current and prior periods plus the current period shipments, implicit benchmark estimates for new orders were derived.

DEFINITION OF TERMS

Value of Shipments

The value of shipments data in the M3 survey represents net selling values, f.o.b. plant to the customer, after discounts and allowances and excluding freight charges and excise taxes. The ASM uses the same definition. However, the data reported in the two surveys frequently are not equal because of differences, discussed earlier, in the reporting unit. For multiestablishment companies, the M3 reports typically are company- or divisional-level reports that encompass groups of plants or products. The data reported are usually net sales and receipts from customers and do not include the value of interplant transfers. The reported sales are used to calculate month-to-month changes which bring forward the universe estimates developed from the ASM.

The value of products made elsewhere under contract from materials owned by the plant is also included in shipments as well as receipts for contract work performed for others, resales, miscellaneous activities such as the sale of scrap and refuse, installation and repair work performed by employees of the plant, and the receipts for research and development performed at the plant.

In the shipbuilding industry, the value of work done in a given year varies considerably from the value of shipments because of the long lead time between the start and

[4]See footnote 2.

completion of a large vessel. In both the annual survey and the M3, the value of work done during the year, rather than the value of shipments, is requested. The same procedure is followed for aircraft produced on a cost-plus contract. Aircraft produced on a fixed-price contract are reported in the usual manner when the products are shipped. Where value of work done is reported in place of shipments, the work-in-process inventories are normally charged to the customer as costs are incurred and are not accumulated as finished goods inventories by the shipyard or the aircraft producer.

The value of shipments figures developed from the ASM contain duplication at the M3 industry category and higher level aggregates, since the products of some four-digit SIC industries are used as materials by other industries within the same M3 industry aggregate. The significance of the duplication within the specific M3 industry categories varies depending on their four-digit industry composition. It is most pronounced in a few highly integrated industry areas, such as primary metals and motor vehicles and parts.

INVENTORIES

Inventories in the M3 survey are collected on a current cost or pre-LIFO (last in, first out) basis. Because different inventory valuation methods are reflected in the reported data, the estimates differ slightly from replacement cost estimates. Companies using the LIFO method for valuing inventories report their pre-LIFO value; that is, the adjustment to their base-period prices is excluded.

In the ASM, inventories are collected according to this same definition. However, there are discontinuities in the historical data in both surveys. Until 1982, respondents were asked in the ASM to report their inventories at book values; that is, according to whatever method they used for tax purposes (LIFO, FIFO, and so forth.) Because of this, the value of aggregate inventories for an industry was not precise. Effective with the 1982 Census of Manufactures, instructions for reporting inventories changed. LIFO users were asked to report inventories prior to the LIFO adjustment, as well as the LIFO reserve and the LIFO value after adjustment for the reserve. Because of this change, the 1982 census data for inventories were published on both bases. Inventory data in subsequent ASM's are available only on a pre-LIFO basis, with no book value estimates comparable to the earlier data.

This change in instructions for reporting current cost inventories was carried to the monthly survey beginning in January 1987. The data for 1982 to 1987 were previously redefined (but not recollected) on a pre-LIFO or current cost basis. As described in the section on benchmarking methodology, the procedure used in adjusting these monthly estimates from a book-value basis to the pre-LIFO levels used the pre-LIFO end-of-year levels from the ASM as constraints and the same general procedure for minimizing revisions to the month-to-month change in the monthly book-value data .

Inventory data are requested from respondents by stage of fabrication; that is, finished goods, work in process, and raw materials and supplies. There are several limitations to the quality of these data for two reasons. First, response to the stage of fabrication inquiries is lower than for total inventories because all companies do not keep their data monthly at this level of detail; those companies which do maintain monthly detailed records frequently do not have data for all three stages of fabrication or have quantity (physical volume) data only. Second, a product considered to be a finished good in one industry, such as steel mills shapes, may be reported as a raw material in another industry, such as stamping plants. Therefore, within the two-digit SIC major groups the same type of inventory may be included under different stage of fabrication categories. Like total inventories, stage of fabrication inventories are also benchmarked to the ASM pre-LIFO data, but the stage of fabrication data are benchmarked at the two-digit major group level.

NEW ORDERS RECEIVED AND UNFILLED ORDERS

New orders, as reported in the monthly survey, are net of order cancellations and include orders received and filled during the month as well as orders received for future delivery. They also include the value of contract changes which increase or decrease the value of the unfilled orders to which they relate. Orders are defined to include those supported by binding legal documents such as signed contracts, letters of award, or letters of intent, although in some industries this definition may not be strictly applicable. In the case of letters of intent, the full amount of the sales value is included if the parties are in substantial agreement on the amount; otherwise, only the funds specifically authorized to be expended are included.

Unfilled orders include orders (as defined above) that have not been reflected as shipments. Generally, unfilled orders at the end of the reporting period are equal to unfilled orders at the beginning of the period plus net new orders received less net shipments.

INSTRUCTIONS FOR COMPLETING THIS FORM

GENERAL INFORMATION

A summary of the instructions for completing this form is provided below. A comprehensive instruction manual is available. Copies of the instruction manual or clarification of instructions or definitions may be obtained by calling the contact on the front of the form or by writing to: **Bureau of the Census, ATTN: Industry Division, Washington, DC 20233-0001.**

- **Purpose for this survey** – This form is designed to collect sales, inventories, and orders data from manufacturing companies for use in the preparation of industry estimates for 79 industry categories encompassing all manufacturing activities. These estimates are widely used as indicators of our Nation's current economic condition and of changes in the business cycle. They also provide important components for estimates of the gross domestic product (GDP) and related series.
- **Activities to be reported** – A REPORTING UNIT is generally a division, subsidiary, or other operating unit as defined by your company for financial or managerial purposes. Reporting units within the same industry category, as defined in the Instruction Manual, may be combined for reporting purposes. Thus, a reporting unit could also be a complete company if the company operates predominantly in a single industry category. The Census Bureau may request that very large units with diverse activities be subdivided along industry lines for reporting purposes.

  For the purposes of this survey, each reporting unit is to be reported as though a separate entity. Sales (or shipments) should include transfers to other segments of your company, as well as sales to unaffiliated customers. Orders, where applicable, should include orders from other segments of your firm. Finally, the reported figures should be limited to domestic operations (the 50 States and the District of Columbia). Please note that, while the activities of foreign subsidiaries should be excluded, export sales to and orders from foreign subsidiaries should be included.
- **Survey deadlines** – The first report for this survey is based on receipts through approximately the 18th of the month following the reporting period. If possible, please return your report by this time. Otherwise, the figures for your company will be estimated for the early report with actual figures included in the final report only. If a portion of the requested items can be reported early, please call or write so that arrangements for reporting of those data items on a separate form can be made.
- **Use of estimates** – If actual figures are not available, reasonable estimates may be used for reporting. Please indicate in the "Remarks" section if figures are estimates.
- **Comparability with previous reports** – Please indicate in the "Remarks" section if there have been any changes in organization or accounting methods that affect comparability with previous reports.

REPORTING DEFINITIONS

A. SALES – Report net sales or shipments made during the reporting period for your domestic manufacturing operations. Include sales of products to other companies, individuals, U.S. Government agencies and foreign customers as well as sales and transfers to other divisions or subsidiaries of your company. Sales should be net, after discounts and allowances, exclusive of nonmanufacturing activities.

B. NEW ORDERS – Report net new orders received during the reporting period less cancellations. Include (1) the sales value of orders received and filled during the reporting period; (2) orders received for future deliveries; and (3) the net sales value of changes to existing contracts. Do not include orders requiring further negotiations, authorization, or funding before the order is final.

C. ORDER BACKLOG – Include orders, as defined above, that have not yet passed through the sales account.

D. TOTAL INVENTORIES – Report total inventories at current cost or market value as of the end of the reporting period. If your inventories are subject to LIFO valuation, report the value prior to the adjustment for the LIFO reserve. The reported figure should include all inventories in the 50 States and the District of Columbia to which you hold title.

The figure for total inventories should equal the sum of the data reported in the following three categories to the extent permitted by your records:

E. MATERIALS AND SUPPLIES INVENTORY – Report materials and supplies inventories at current cost or market value as of the end of the reporting period.

F. WORK-IN-PROCESS INVENTORY – Report work-in-process inventories at current cost or market value as of the end of the reporting period.

G. FINISHED GOODS INVENTORY – Report finished goods inventories at current cost or market value as of the end of the reporting period.

FORM M-3(SD) (6-8-92)

Appendix B.
Composition of Industry Categories in Terms of 1987 Standard Industrial Classification System

M3/SIC code	M3 category title with comparable four-digit SIC titles
	FOOD AND KINDRED PRODUCTS
20A	**Meat products**
2011	Meat packing plants
2013	Sausages and other prepared meats
2015	Poultry slaughtering and processing
20B	**Dairy products**
2021	Creamery butter
2022	Cheese, natural and processed
2023	Dry, condensed, evaporated products
2024	Ice cream and frozen desserts
2026	Fluid milk
20C	**Fats and oils**
2074	Cottonseed oil mills
2075	Soybean oil mills
2076	Vegetable oil mills, n.e.c.
2077	Animal and marine fats and oils
2079	Edible fats and oils, n.e.c.
20D	**Beverages**
2082	Malt beverages
2083	Malt
2084	Wines, brandy, and brandy spirits
2085	Distilled and blended liquors
2086	Bottled and canned soft drinks
2087	Flavoring extracts and syrups, n.e.c.
20E	**Food and kindred products, except meat and dairy products, beverages, fats, and oils**
2032	Canned specialties
2033	Canned fruits and vegetables
2034	Dehydrated fruits, vegetables, and soups
2035	Pickles, sauces, and salad dressings
2037	Frozen fruits and vegetables
2038	Frozen specialties, n.e.c.
2041	Flour and other grain mill products
2043	Cereal breakfast foods
2044	Rice milling
2045	Prepared flour mixes and doughs
2046	Wet corn milling
2047	Dog and cat food
2048	Prepared feeds, n.e.c.
2051	Bread, cake, and related products
2052	Cookies and crackers
2053	Frozen bakery products, except bread
2061	Raw cane sugar
2062	Cane sugar refining
2063	Beet sugar
2064	Candy and other confectionery products
2066	Chocolate and cocoa products
2067	Chewing gum
2068	Salted and roasted nuts and seeds
2091	Canned and cured fish and seafoods
2092	Fresh or frozen prepared fish
2095	Roasted coffee
2096	Potato chips and similar snacks
2097	Manufactured ice
2098	Macaroni and spaghetti
2099	Food preparations, n.e.c.

M3/SIC code	M3 category title with comparable four-digit SIC titles
	TOBACCO PRODUCTS
21A	**Cigarettes, cigars, chewing and smoking tobacco, and snuff**
2111	Cigarettes
2121	Cigars
2131	Chewing and smoking tobacco
2141	Tobacco stemming and redrying
	TEXTILE MILL PRODUCTS
22A	**Broadwoven fabrics and textiles, except those from knitting and floor covering mills**
2211	Broadwoven fabric mills, cotton
2221	Broadwoven fabric mills, manmade
2231	Broadwoven fabric mills, wool
2241	Narrow fabric mills
2261	Finishing plants, cotton
2262	Finishing plants, manmade
2269	Finishing plants, n.e.c.
2281	Yarn spinning mills
2282	Throwing and winding mills
2284	Thread mills
2295	Coated fabrics, not rubberized
2296	Tire cord and fabrics
2297	Nonwoven fabrics
2298	Cordage and twine
2299	Textile goods, n.e.c.
22B	**Knitting mill products**
2251	Women's hosiery, except socks
2252	Hosiery, n.e.c.
2253	Knit outerwear mills
2254	Knit underwear mills
2257	Weft knit fabric mills
2258	Lace and warp knit fabric mills
2259	Knitting mills, n.e.c.
22C	**Carpets and rugs**
2273	Carpets and rug
	APPAREL AND OTHER FINISHED TEXTILE PRODUCTS
23A	**Apparel and other finished textile products**
2311	Men's and boys' suits and coats
2321	Men's and boys' shirts
2322	Men's and boys' underwear and nightwear
2323	Men's and boys' neckwear
2325	Men's and boys' trousers and slacks
2326	Men's and boys' work clothing
2329	Men's and boys' clothing, n.e.c.
2331	Women's and misses' blouses and shirts
2335	Women's, juniors' and misses' dresses
2337	Women's and misses' suits and coats
2339	Women's and misses' outerwear, n.e.c.
2341	Women's and children's underwear
2342	Bras, girdles, and allied garments
2353	Hats, caps, and millinery
2361	Girls' and children's dresses and blouses
2369	Girls' and children's outerwear, n.e.c.

M3/SIC code	M3 category title with comparable four-digit SIC titles
	APPAREL AND OTHER FINISHED TEXTILE PRODUCTS—Con.
23A	**Apparel and other finished textile products**—Con.
2371	Fur goods
2381	Fabric dress and work gloves
2384	Robes and dressing gowns
2385	Waterproof outerwear
2386	Leather and sheep-lined clothing
2387	Apparel belts
2389	Apparel and accessories, n.e.c.
2391	Curtains and draperies
2392	Housefurnishings, n.e.c.
2393	Textile bags
2394	Canvas and related products
2395	Pleating and stitching
2396	Automotive and apparel trimmings
2397	Schiffli machine embroideries
2399	Fabricated textile products, n.e.c.
	LUMBER AND WOOD PRODUCTS
24A	**Wood containers, pallets and skids**
2441	Nailed wood boxes and shook
2448	Wood pallets and skids
2449	Wood containers, n.e.c.
24B	**Wood buildings and mobile homes**
2451	Mobile homes
2452	Prefabricated wood buildings
24C	**Wood products, except containers, buildings, and mobile homes**
2411	Logging
2421	Sawmills and planning mills, general
2426	Hardwood dimension and flooring mills
2429	Special product sawmills, n.e.c.
2431	Millwork

Appendix C.
Composition of Aggregate Data Series in Terms of M3 Industry Series by Market Categories

AUTOMOTIVE EQUIPMENT

30A Tires and tubes (pt)
36I Miscellaneous electrical equipment and supplies (pt)
37A Motor vehicle parts, accessories, and bodies, except car bodies (pt)
37B Motor vehicles and car bodies (pt)
37J Boats, motorcycles, bicycles, travel trailers, and campers

HOME GOODS AND APPAREL

22B Knitting mill products
22C Carpets and rugs
23A Apparel and other finished textile products
25A Household furniture
30B Rubber and plastics footwear, hose, belting, gaskets, and other rubber products, n.e.c. (pt)
31B Leather products, except tanning, finishing, and footwear cut stock
32B Kitchen articles and pottery
32C Stone, clay, and glass products, except glass containers, kitchen articles, and pottery (pt)
34B Cutlery and handtools (pt)
35I Refrigeration, heating, and service industry machinery (pt)
36C Household appliances
36E Household audio and video equipment
38E Ophthalmic goods, watches and clocks
39A Miscellaneous personal goods, such as jewelry, silverware, toys and games, sporting goods, musical instruments, and burial caskets

CONSUMER STAPLES

20A Meat products
20B Dairy products
20C Fats and oils (pt)
20D Beverages (pt)
20E Food and kindred products, except meat and dairy products, beverages, fats, and oils (pt)
21A Cigarettes, cigars, and chewing and smoking tobacco and snuff
26C Miscellaneous converted paper products (pt)
27A Newspapers, periodicals, and books (pt)
27B Publishing and printing products, except newspapers, periodicals, and books (pt)
28C Drugs, soaps, and toiletries
29B Petroleum refining, except paving and roofing materials (pt)

MACHINERY AND EQUIPMENT

24B Wood buildings and mobile homes
25B Furniture, except household (pt)
34C Building materials and wire products (pt)
35A Steam engines and turbines (including nuclear)
35C Farm and garden machinery
35D Construction, mining, and material handling equipment
35E Metalworking machinery
35F Special industry machinery
35G General industrial machinery (pt)
35H Computer and office equipment (pt)
35I Refrigeration, heating, and service industry machinery (pt)
36A Electrical transmission and distribution equipment
36F Communication equipment, except for the Department of Defense
37A Motor vehicle parts, accessories, and bodies, except car bodies (pt)
37B Motor vehicles and car bodies (pt)
37C Complete aircraft, missiles, and space vehicles, except for the Department of Defense
37E Aircraft, missile, and space vehicle engines and parts, except for the Department of Defense (pt)
37G Ships and tank components, except for the Department of Defense
37I Railroad equipment
38A Search and navigation equipment, except for the Department of Defense
38D Medical instruments and supplies
38F Photographic goods

BUSINESS SUPPLIES

20E Food and kindred products, except meat and dairy products, beverages, and fats and oils (pt)
26C Miscellaneous converted paper products (pt)

27A Newspapers, periodicals, and books (pt)
27B Publishing and printing products, except newspapers, periodicals, and books (pt)
28A Chemical products, except paints, drugs, soaps, toiletries, and agricultural chemicals (pt)
28D Agricultural chemicals (pt)
29B Petroleum refining, except paving and roofing materials (pt)
30A Tires and tubes (pt)
34C Building materials and wire products (pt)
34F Miscellaneous fabricated metal products, except containers, cutlery, building materials, ordnance, and ammunition (pt)
39B Miscellaneous manufactures, except personal goods

CONSTRUCTION MATERIALS AND SUPPLIES

24C Wood products, except containers, buildings, and mobile homes (pt)
25B Furniture, except household (pt)
26A Pulp, paper, and paperboard mill products (pt)
28B Paints and related products
29A Asphalt paving and roofing materials
30C Miscellaneous plastics products, n.e.c. (pt)
32C Stone, clay, and glass products, except glass containers, kitchen articles, and pottery (pt)
33A Blast furnaces and steel mill products (pt)
33C Nonferrous metal products, primary and secondary (pt)
34C Building materials and wire products (pt)
36D Electric lighting and wiring equipment

DEFENSE PRODUCTS

28A Chemical products, except paints, drugs, soaps, toiletries, and agricultural chemicals (pt)
34X Ordnance and accessories
36G Communication equipment for the Department of Defense
37D Complete aircraft, missiles, and space vehicles for the Department of Defense
37F Aircraft, missiles, and space vehicle engines and parts for the Department of Defense (pt)
37H Ships, tanks, and tank components for the Department of Defense
38B Search and navigation equipment for the Department of Defense

OTHER MATERIALS AND INTERMEDIATE PRODUCTS

20C Fats and oils (pt)
20D Beverages (pt)
20E Food and kindred products, except meat and dairy products, beverages, and fats and oils (pt)
22A Broadwoven fabrics and textiles, except those from knitting and floor covering mills
24A Wood containers, pallets, and skids
24C Wood products, except containers, buildings, and mobile homes (pt)
26A Pulp, paper, and paperboard mill products (pt)
26B Paperboard containers and boxes
26C Miscellaneous converted paper products (pt)
28A Chemical products, except paints, drugs, soaps, toiletries, and agricultural chemicals (pt)
28B Paints and related products (pt)
28D Agricultural chemicals (pt)
29B Petroleum refining, except paving and roofing materials (pt)
30A Tires and tubes (pt)
30B Rubber and plastics footwear, hose, belting, gaskets, and other rubber products, n.e.c. (pt)
30C Miscellaneous plastics products, n.e.c. (pt)
31A Leather tanning and finishing and footwear cut stock
32A Glass containers
32C Stone, clay, and glass products, except glass containers, kitchen articles, and pottery (pt)
33A Blast furnaces and steel mill products (pt)
33B Iron and steel foundry products
33C Nonferrous metal products, primary and secondary (pt)
34A Metal cans and shipping containers
34B Cutlery and handtools (pt)
34C Building materials and wire products (pt)
34F Miscellaneous fabricated metal products, except containers, cutlery, building materials, ordnance, and ammunition (pt)
35B Internal combustion engines including diesel, except automotive and aircraft
35G General industrial machinery (pt)
35H Computer and office equipment (pt)
35J Industrial machinery, n.e.c.
36B Electrical industrial apparatus
36H Electronic components and accessories
36I Miscellaneous electrical equipment and supplies (pt)

30B Rubber and plastics footwear, hose, belting, gaskets, and other rubber products, n.e.c. (pt)
30C Miscellaneous plastics products, n.e.c. (pt)
38D Medical instruments and supplies

Appendix D.
Benchmarking Procedures Used in Revising Historical M3 Shipments and Inventory Estimates: 1994-1996

The mathematical technique used in benchmarking historical data in the M3 survey generally follows a trend revision minimization approach with constraints determined by annual benchmarks. The objective function F

$$F = \sum_{i=0}^{n-1} [(Y_{i+1}/Y_i) - (X_{i+1}/X_i)]^2$$

defines the sum of squared differences in the month-to-month trend between the original and revised data.

where $i = 0 =$ December 1993
$i = n =$ December 1996

Y_{i+1}/Y_i = revised ratio of change from month_i to month_{i+1}

X_{i+1}/X_i = original ratio of change from month_i to month_{i+1}

For shipments and inventories, monthly data for the 80 M3 industry categories are benchmarked using the trend minimization function F.

Constraints for shipments are:

$$\sum Y_i = 1994 \text{ Benchmark; } i \epsilon\ 1994$$

$$\sum Y_i = 1995 \text{ Benchmark; } i \epsilon\ 1995$$

$$\sum Y_i = 1996 \text{ Benchmark; } i \epsilon\ 1996$$

Constraints for inventories are:

Y_0 = December 1993 Benchmark
Y_{12} = December 1994 Benchmark
Y_{24} = December 1995 Benchmark
Y_{36} = December 1996 Benchmark

Stage of fabrication inventories are tabulated and benchmarked at the two-digit SIC major group level using the procedure described for total inventories.

Any imbalances between the sum of the three stages of fabrication and the total inventory data at the two-digit SIC major group level are corrected by the following raking procedure:

$$MI_J^A = MI_J^O[TI_J / (MI_J^O + WI_J^O + FI_J^O)]$$

$$WI_J^A = WI_J^O[TI_J / (MI_J^O + WI_J^O + FI_J^O)]$$

$$FI_J^A = FI_J^O[TI_J / (MI_J^O + WI_J^O + FI_J^O)]$$

for J = 0 through n
where 0 = January 1994
n = December 1996

MI_J^O and MI_J^A are materials and supplies original and as raked.
WI_J^O and WI_J^A are work in process original and as raked
FI_J^O and FI_J^A are finished goods original and as raked
TI_J = Benchmarked total inventories

Table D–1. **Benchmark Data for Shipments and Total Inventories for M3 Industry Categories: 1995 and 1996**

[Million dollars]

Industry category	Shipments		Inventories	
	1996	1995	1996	1995
SHIPMENTS

Appendix E.
Benchmarking Procedures Used in Revising Historical M3 Unfilled Orders and New Orders Estimates: 1994-1996

The estimation procedure followed in calculating new and unfilled orders consistent with the benchmarked shipments and inventory data discussed in appendix D is described below. Revisions to the unfilled orders estimates are based on a trend revision minimization approach defined by objective function F with constraints determined by the equations given below.

$$F=\sum_{i=0}^{n-1}[(Y_{i+1}/Y_i) - (X_{i+1}/X_i)]^2$$

where i = 0 = December 1994
i = n = December 1996

Y_{i+1}/Y_i = revised ratio of change from $month_i$ to $month_{i+1}$
X_{i+1}/X_i = original ratio of change from $month_i$ to $month_{i+1}$

Monthly unfilled orders data for 1995 and later are adjusted to be consistent with 1995-1996 ASM shipments estimates using the trend minimization function F with constraints for end-of-year unfilled orders (Y_i) determined as follows:

for i = 0, Y_0 = the current M3 end-of-year unfilled orders (UFO) estimates for 1994
for i = 12 = December 1995
for i = 24 = December 1996

$$Y_i^A = Y_i^O(S_i^A/S_i^O)$$

where Y_{12}^A = adjusted end-of-year 1995 UFO
Y_{12}^O = original M3 end-of-year 1995 UFO
S_{12}^A = ASM annual shipments estimates for 1995
S_{12}^O = M3 annual shipments estimate for1995

Y_{24}^A = adjusted end-of-year 1996 UFO
Y_{24}^O = original M3 end-of-year 1996 UFO
S_{24}^A = ASM annual shipments estimates for 1996
S_{24}^O = M3 annual shipments estimate for 1996

Monthly new orders estimates are derived consistent with the benchmarked shipments and unfilled orders monthly data using the following relation.

$$X_J = S_J + (Y_J - Y_{J-1})$$

for J = 1 through n
J = 1= January 1995
J = n = December 1996
X_J = Benchmarked new orders
S_J = Benchmarked shipments
Y_J = Benchmarked unfilled orders

Appendix F.
Notes on Trading Day Adjustment Methodology and Weight Patterns

The shipments data in the M3 survey are adjusted for calendar month variations, both length of month and number of trading days per month. The selection of these adjustment factors is based primarily on recognition of patterns contained in the data using the regression and spectral analysis capabilities of the X-12 seasonal adjustment software.

Factors are considered optimal when the daily weights assigned to the industry eliminate or diminish the peaks in the spectral plots, which are based on calendar frequencies, and lower the absolute value of the month-to-month change in the residual irregular component (I) of the data series. Several variations of the calculation and application of these weights provided multiple versions of the irregular component values. The set of weights selected were those which realized the lowest I value. The following table contains the daily weights used for each industry. For trading day weights before 1987, see table F-1 of M3-1(90).

New orders data in this publication are implicitly trading day adjusted by using the trading day adjusted shipments as input to their derivation. The change in unfilled orders is not trading day adjusted.

Table F–1. **Trading Day Weight Patterns and Diagnostics**

Series	Daily weights								
	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday	Sunday	Trading day adjustment indicator	F ratio[1]

[1]The F value measures the presence of stable trading day patterns and is the quotient of the between months' variance attributable to the trading day component and the residual variance attributable to the irregular component. Values greater than 7 indicate there is a significant trading day pattern present.

Note: Daily weights may not add to 7 because of independent rounding.

Appendix G.
Summary Measures for Evaluating the Quality of the Seasonal Adjustment of M3 Series

The measures shown in the following table were used in evaluating the current seasonal adjustment procedure. Brief descriptions of the measures follow.

The average absolute percentage change without regard to sign is the average of the absolute percentage changes between all pairs of adjacent months; it is one measure of variability.

The ''O'' is the average month-to-month percentage change, without regard to sign, in the original series. The ''CI'' is the same for the seasonally adjusted series. The ''C'' is the same for the cyclical component which is a smooth, flexible moving average of the seasonally adjusted series. The ''I'' is the same for the irregular component, which is obtained by dividing the cyclical component into the seasonally adjusted series.

The ''IC'' is the average relative month-to-month change, without regard to sign, of the irregular component divided by the average relative month-to-month change, without regard to sign, of the cyclical component. It serves as an indication of the series' relative irregularity.

The measures of relative contributions of the component series to the variation in the original series can be interpreted as measures of the absolute importance of each component. The percentages shown are actually the percentages of the total variance obtained by adding up the variances of the individual components and may differ from those using the variance computed directly from the original series. The I is the irregular component; C is the trend component; and S, the seasonal component. A value of I greater than 30 usually indicates that the erratic movements in the series will significantly diminish the ability of X-12 to identify the seasonal movements in the data. Values of S less than 50 suggest that the seasonal movements are difficult to quantify.

The F value presented here measures the presence of stable seasonality. It is the quotient of two variances: (1) the between months variance, which is mainly due to seasonal, and (2) the residual variance, which is mainly due to irregular. A value of 7.0 or greater is used as an indicator of the presence of stable seasonality.

The Q value is a weighted average of 11 different quality control statistics concerned variously with the irregular movements of the series and with seasonal patterns changing too rapidly to be identifiable, particularly in recent years. A value greater than 1.2 is unacceptable; whereas, values less than 0.8 often indicate an acceptable adjustment. With values between 0.8 and 1.2, other measures must be consulted to determine if the seasonal movement in the series can be adequately quantified by the X-12 program.

The SF_r and MM_c are diagnostics from the sliding spans tests. The SF_r measures the amount of revision in a seasonal factor for a specific observation which occurs as the specific years included in the seasonal adjustment analysis change. For example, for most series in this publication a 14-year series is examined as four 11-year spans: 1982-1992, 1983-1993, 1984-1994, and 1985-1995. For the SF_r, it is considered acceptable if no more than 25 percent of the seasonal factors are revised by more than 3 percent for Q values less than or equal to 0.8; for Q values between 0.8 and 1.2, the SF_r should be no more than 15 percent.

The MM_c is a measure of the revision in the month-to-month percent change for specific observations, as the years included in the span are changed. It is considered acceptable if no more than 40 percent of the observations are revised by more than 3 percent.

The range of seasonal factors gives the difference between the largest upward adjustment and the largest downward adjustment and, therefore, measures the extent of the seasonal movements estimated by the program. An NS in the last column indicates a series is not seasonally adjusted in this publication. The information in the other columns for these series is the measures produced in X-12 ARIMA and sliding spans runs to determine the presence of quantifiable seasonality. For series which are not seasonally adjusted in this publication, the original unadjusted values are included in both the seasonally adjusted and unadjusted totals.

Appendix H.
Description of the Annual Survey of Manufactures; the M3 Benchmark Data

GENERAL

The estimates for 1996 are based on reports from a representative sample of approximately 58,000 manufacturing establishments and administrative-record information for approximately 170,000 establishments. These estimates represent the portion of the manufacturing population accounted for by establishments with paid employees. Nonemployers are defined as out-of-scope of the ASM. The tables provide 1996 and 1995 estimates for employment, plant hours, payrolls, value added by manufacture, capital expenditures, cost of materials, inventories, value of industry shipments, and fuels and electric energy consumed for most manufacturing industries. Establishments are classified in manufacturing industries by industry definitions described in the 1987 edition of the Standard Industrial Classification (SIC) Manual.[1]

SCOPE AND USE OF ANNUAL SURVEY

The 1996 ASM is the 39th survey of this type conducted by the Bureau of the Census to provide the key measures of manufacturing activity for industry groups and important industries for intercensal years. These key measures, as well as other detailed statistics for manufacturing, were collected in the censuses of manufactures; the three most recent censuses covered the years 1992, 1987, and 1982. An annual survey was conducted for each of the years between censuses starting with 1949.

During intercensal periods, these annual surveys provide a continuous series of basic statistics for industries and furnish benchmarks for current business indicators and for measures of industrial production and productivity. The survey also provides significant data in connection with planning for industrial mobilization.

DESCRIPTION OF THE SURVEY SAMPLE

In 1992, there were approximately 370,000 individual manufacturing establishments. For sample efficiency and cost considerations, the 1992 manufacturing population was partitioned into two components for developing estimates within the ASM; a mail stratum and a nonmail stratum.

Mail stratum. The mail stratum of the survey is comprised of larger single-location manufacturing companies and all manufacturing establishments of multiunit companies (companies that operate at more than one physical location). Approximately 230,000 of the 370,000 establishments in the 1992 census were assigned to the mail stratum.

On an annual basis, the mail stratum is supplemented with larger, newly active single-location companies identified from a list provided by the Internal Revenue Service (IRS) and new manufacturing locations of multiunit companies identified from the Census Bureau's Company Organization Survey (COS).

For the 1994 survey, a new sample of approximately 58,000 individual establishments was selected from the mail stratum assembled from the 1992 census. Supplemental samples representing both 1993 and 1994 births (newly active establishments that were not included in the 1992 census) were also selected. Establishments selected for the sample will be mailed an ASM survey questionnaire for each year through 1998.

The 1994-98 ASM sample design is similar to the one used since 1984. Companies in the 1992 Census of Manufactures with manufacturing shipments of at least $500 million were defined as company certainties. For these large companies, each manufacturing establishment is included in the mail sample. For the 1994-98 sample, there are approximately 650 certainty companies collectively accounting for over 18,000 establishments.

For the remaining portion of the mail component of the survey, the establishment was defined as the sample unit. All establishments with 250 employees or more were defined as employment certainties. In addition, all establishments producing products in SIC 3571 (Electronic Computers) were defined as certainties. Across these three arbitrary certainty classes, there were approximately 25,000 establishments included in the sample with certainty. Collectively, these certainty establishments accounted for approximately 80 percent of the total value of shipments in the 1992 Census of Manufactures.

Smaller establishments in the remaining portion of the mail stratum were sampled with probabilities ranging from .02 to 1.00. The initial probabilities of selection assigned to these establishments were proportionate to a measure-of-size determined for each establishment. The measure-of-size was a function of the establishment's 1992 industry classification, it's 1992 product class data, and the historical variability of the year-to-year estimates of the product

[1] *Standard Industrial Classification Manual: 1987.* For sale by Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. Stock No. 041-001-00314-2.

class estimates. For each product class (1,755) and four-digit industry (459), a desired reliability constraint was specified. Using a technique developed by Dr. James R. Chromy of the Research Triangle Institute, the initial establishment probabilities were optimized such that the expected sample satisfied all industry and product class reliability constraints while the sample size was minimized. This technique reduces the likelihood of selecting nonrepresentative samples for individual product classes or industries.

This method of assigning probabilities based on product class shipments is motivated by our primary desire to produce reliable estimates of both product class and industry shipments. The high correlation between shipments and employment, value-added, and other general statistics assures that these variables will also be well represented by the sample. The actual sample selection procedure uses an independent chance of selection method (Poisson sampling) which permits us to prevent small establishments from being selected in consecutive samples without introducing a bias into the survey estimates.

Nonmail component. The initial nonmail component of the survey was comprised of approximately 140,000 small, single-establishment companies that were tabulated as administrative records in the 1992 Census of Manufactures. The nonmail stratum is also supplemented annually using the list of newly active single-location companies provided by the IRS and payroll cutoffs. Companies with payroll below the payroll cutoff are added to the nonmail stratum.

For this portion of the population, sampling is not used. The data for this group are estimated based on selected information obtained annually from the administrative records of the IRS and Social Security Administration (SSA). This administrative information, which includes payroll, total employment, industry classification, and physical location, is obtained under conditions which safeguard the confidentiality of both tax and census records.

DESCRIPTION OF THE ESTIMATING PROCEDURE

Most of the ASM estimates derived for the mail stratum are computed using a difference estimator. At the establishment level, there is a strong correlation between the current year data values and the corresponding 1992 (base) data values. Therefore, within the mailed stratum, for each item at each level of aggregation, an estimate of the ''difference'' between the current year and the base year is computed from sample cases and added to the corresponding base year values. For the 1993-1997 ASM estimates, the 1992 Census of Manufactures values serve as the base year. For the 1998 ASM, the base will be updated to be the 1997 Census of Manufactures.

Due to the positive year-to-year correlation, estimates derived using this methodology are generally more reliable than comparable estimates developed from the current sample data alone. Estimates for the capital expenditures variables are not generated using the difference estimator because the year-to-year correlations are considerably weaker. The standard linear estimator is used for these variables.

For the nonmail stratum, estimates for payroll and employment are directly tabulated from the administrative-record data provided by IRS and SSA. Estimates of data other than payroll and employment are developed from industry averages. Although the nonmail stratum contains approximately 170,000 individual establishments in 1994, it accounts for less than 2 percent of the estimate for total value of shipments at the total manufacturing level.

Corresponding estimates for the mail and nonmail components are combined to produce the estimates included in this publication.

QUALIFICATIONS OF THE DATA

The estimates developed from the sample are apt to differ somewhat from the results of a survey covering all companies in the sample lists but otherwise conducted under essentially the same conditions as the actual sample survey. The estimates of the magnitude of the sampling errors (the difference between the estimates obtained and the results theoretically obtained from a comparable, complete-coverage survey) are provided by the standard errors of estimates.

The particular sample selected for the ASM is one of many similar probability samples that, by chance, might have been selected under the same specifications. Each of the possible samples would yield somewhat different sets of results, and the standard errors are measures of the variation of all the possible sample estimates around the theoretical, comparable, complete-coverage values.

Estimates of the standard errors have been computed from the sample data for selected statistics in this report. They are represented in the form of relative standard errors (the standard errors divided by the estimated values to which they refer).

In conjunction with its associated estimate, the relative standard error may be used to define confidence intervals (ranges that would include the comparable, complete-coverage value for specified percentages of all the possible samples).

The complete coverage value would be included in the range:

1. From one standard error below to one standard error above the derived estimate for about two-thirds of all possible samples.

2. From two standard errors below to two standard errors above the derived estimate for about 19 out of 20 of all possible samples.

3. From three standard errors below to three standard errors above the derived estimate for nearly all samples.

An inference that the comparable, complete-survey result would be within the indicated ranges would be correct in approximately the relative frequencies shown. Those proportions, therefore, may be interpreted as defining the confidence that the estimates from a particular sample would differ from complete-coverage results by as much as one, two, or three standard errors, respectively.

For example, suppose an estimated total is shown at 50,000 with an associated relative standard error of 2 percent, that is, a standard error of 1,000 (2 percent of 50,000). There is approximately 67 percent confidence that the interval 49,000 to 51,000 includes the complete-coverage total, about 95 percent confidence that the interval 48,000 to 52,000 includes the complete-coverage total, and almost certain confidence that the interval 47,000 to 53,000 includes the complete-coverage total.

In addition to the sample errors, the estimates are subject to various response and operational errors: errors of collection, reporting, coding, transcription, imputation for nonresponse, etc. These operational errors also would occur if a complete canvass were to be conducted under the same conditions as the survey. Explicit measures of their effects generally are not available. However, it is believed that most of the important operational errors were detected and corrected during the Census Bureau's review of the data for reasonableness and consistency. The small operational errors usually remain. To some extent, they are compensating in the aggregated totals shown. When important operational errors were detected too late to correct the estimates, the data were suppressed or were specifically qualified in the tables.

As derived, the estimated standard errors included part of the effect of the operational errors. The total errors, which depend upon the joint effect of the sampling and operational errors, are usually of the order of size indicated by the standard error, or moderately higher. However, for particular estimates, the total error may considerably exceed the standard errors shown. Any figures shown in the tables in this publication having an associated standard error exceeding 15 percent may be combined with higher level totals, creating a broader aggregate, which then may be of acceptable reliability.

DESCRIPTION OF IMPUTATION PROCEDURE

The need for imputation in the ASM arises from several sources. Complete nonresponse, partial nonresponse, inconsistent reported data, and the Bureau's desire to reduce the reporting burden for small manufacturers are the primary factors contributing to the need for imputation.

For purposes of the ASM, an item is considered to be an impute if the value was not directly reported on the questionnaire, directly derived from other reported items, directly available from supplemental sources, or obtained from the respondent during the analytical review phase.

In imputing records for nonrespondents, two basic approaches are followed. For most larger establishments, operational information is available from the prior-year ASM. Imputation for 1996 data for establishments with 1995 data available involves adjusting the corresponding 1995 data by estimates of the year-to-year relative change. These estimates are developed based on employment and payroll data from the Bureau of Labor Statistics at the industry group (three-digit SIC) level and are then applied to the 1995 prior-year establishment values for employment and payroll. The remaining data for the establishment are developed based on their prior-year relationship to these two control items. For nonrespondents that have no prior-year record available including establishments not included in the mail portion of the survey, administrative-record data for annual payroll and employment are used. For all other items, industry average relationships between these control items and the item to be imputed are used.

At the total manufacturing level, the overall imputation rate is approximately 7 percent of the published value of shipments figure for 1996. However, this rate varies widely by four-digit industry, five-digit product class, and State total. The median imputation rate for a four-digit industry was 10 percent; for a five-digit product class, the rate was somewhat higher; and for a State total, the rate was comparable to the four-digit industry.

EXPLANATION OF TERMS

Value of Shipments

This item covers the received or receivable net selling values, f.o.b. plant (exclusive of freight and taxes), of all products shipped, both primary and secondary, as well as all miscellaneous receipts, such as receipts for contract work performed for others, installation and repair, sales of scrap, and sales of products bought and resold without further processing. Included are all items made by or for the establishments from materials owned by it, whether sold, transferred to other plants of the same company, or shipped on consignment. The net selling value of products made in one plant on a contract basis from materials owned by another was reported by the plant providing the materials.

In the case of multiestablishment companies, the manufacturer was requested to report the value of products transferred to other establishments of the same company at full economic or commercial value, including not only the direct cost of production but also a reasonable proportion of ''all other costs'' (including company overhead) and profit. (See discussion of duplication of data below.)

End-of-Year Inventories

Respondents were asked to report their 1994 and 1995 end-of-year inventories at cost or market. Effective with the 1982 Economic Censuses, this change to a uniform instruction for reporting inventories was introduced for all sector

reports. Prior to 1982, respondents were permitted to value inventories using any generally accepted accounting method (FIFO, LIFO, market, to name a few). In 1982, LIFO users were asked to first report inventory values prior to the LIFO adjustment and then to report the LIFO reserve and the LIFO value after adjustment for the reserve.

Because of this change in reporting instructions, 1982 through 1996 data for inventories are not comparable to the prior-year data in historical censuses of manufactures and ASM publications.

When using inventory data by stage of fabrication for ''all industries'' and at the two-digit industry level, it should be noted that an item treated as a finished product by an establishment in one industry may be reported as a raw material by another establishment in a different industry. For example, the finished-product inventories of a steel mill would be reported as raw materials by a stamping plant. Such differences are present in the inventory figures by stage of fabrication shown for individual industries, industry groups, and manufacturing totals, which are aggregates of figures reported by establishments in specified industries.
