FOR RELEASE 10:00 AM EST, THURSDAY, JANUARY 3, 2002

CB02-01

NOVEMBER 2001 CONSTRUCTION AT \$865.1 BILLION ANNUAL RATE

Construction put in place during November 2001 was estimated at a seasonally adjusted annual rate of \$865.1 billion, 1 (± 5) percent above the revised October estimate of \$858.6 billion, according to the U.S. Commerce Department's Census Bureau. The November figure represents a 5 (± 5) percent increase over November 2000.

During the first 11 months of this year \$798.6 billion of construction was put in place, 6 percent above the \$752.8 billion for the same period in 2000.

In constant (1996) dollars, the November annual rate was \$721.9 billion, 1 (± 5) percent above the revised estimate of \$715.9 billion for October.

PRIVATE CONSTRUCTION

Spending on new residential housing units was at a seasonally adjusted annual rate of \$277.5 billion in November, 1 (± 2) percent below the revised October estimate of \$279.1 billion. Nonresidential building construction was at a rate of \$197.7 billion, nearly the same (± 3 percent) as the revised October estimate of \$196.8 billion.

PUBLIC CONSTRUCTION

In November, the estimated seasonally adjusted annual rate of public construction put in place was \$215.1 billion, 5 (± 5) percent above the revised October estimate of \$205.6 billion.

December 2001 data will be released on February 1, 2002 at 10:00 AM EST .

EXPLANATORY NOTES

In interpreting changes in the statistics in this release, note that month-to-month changes in seasonally adjusted statistics often show movements which may be irregular. It may take 2 months to establish an underlying trend for total construction and as long as 8 months for specific categories of construction.

The statistics in this release are estimated from several sources and surveys and are subject to sampling variability as well as nonsampling errors including bias and variance from response, nonreporting, and undercoverage. Estimates of the standard errors are provided in Table 4 for selected types of construction. Whenever a statement such as "2 (± 3) percent above" appears in the text, this indicates the range (-1 to +5 percent) in which the actual percent change is likely to have occurred. All ranges given are 90 percent confidence intervals. If the range contains zero, it is uncertain whether there was an increase or decrease; that is, the change was not statistically significant. For any comparison cited without a confidence interval, the change is statistically significant. Statistics for the current month are preliminary estimates subject to revision in following months as additional data become available. The average absolute percent changes from preliminary estimate to first revision for the major seasonally adjusted components are as follows: total construction, 0.5 percent; private construction, 0.6 percent; private residential construction, 0.5 percent; private nonresidential construction, 1.1 percent; and public construction, 1.4 percent.

More detailed data will appear in Current Construction Reports, C30/01-11, to be issued later this month. A discussion of sources and reliability of the data appears in Current Construction Reports, C30/01-5.

Note: The fixed-weighted price index is a weighted average of the individual price index series used to deflate the Value of Construction Put in Place (VIP) series. In calculating the index, the weights (the composition of current dollar VIP in 1996 by category of construction) are held constant. Consequently, the index reflects only changes in prices. The implicit price deflator is a derived ratio of total current to constant dollar VIP (multiplied by 100). It is the average of the individual price indexes used in the deflation of VIP, but the prices are weighted by the composition of VIP each period. As a result, the implicit price deflator reflects not only changes in prices, but also changes in the composition of VIP, and its use as a measure of price change is discouraged.

NA Not available.

Note: All statistics are based upon 2000 data. The coefficient (k1) for the month-to-month change is applicable to change from the previous month and change from the same month a year ago.

The standard errors (SE) for month-to-month and year-to-date changes may be approximated by the following formula with the appropriate coefficient shown in Table 4:

$$SE(\text{change}) = (k1 \text{ or } k2) (100 + \% \text{ change shown in table}).$$

For example, Table 1 shows that private 'educational' construction increased 4 percent from last month. The standard error of the 4 percent increase is about equal to 10 percentage points:

$$SE(4\% \text{ increase}) = (.10)(100+4) = (.10)(104) = 10\%$$

Once the standard error is available, one can construct a 90 percent confidence interval of the change by multiplying the standard error by 1.6. In the above example, an approximate 90 percent confidence interval of the 4 percent increase for private 'educational' construction would be between:

$$20 \text{ and } -12 \text{ percent (4\% plus or minus } (10\% \times 1.6)).$$
