

Population Trends in Incorporated Places: 2000 to 2013

Population Estimates and Projections

Current Population Reports

By Darryl T. Cohen

(With Geoffrey W. Hatchard and Steven G. Wilson)

Issued March 2015

P25-1142

INTRODUCTION

Nearly two-thirds of Americans live in incorporated places, commonly referred to as cities. As the majority of the nation's population lives in cities, patterns of population change among cities and the social and economic conditions affecting them often represent national trends. Using data from the 2000 and 2010 censuses and 2013 population estimates, this report examines the population in cities and highlights how city populations changed between 2000 and 2010, and between 2010 and 2013. The report discusses the distribution of the population in cities by region, state, and city population size. It also highlights the fastest-growing cities, city population densities, annexation, and new incorporations between 2010 and 2013.

Incorporated places are local governmental entities with powers to collect taxes and provide services within legally defined geographic boundaries. State laws govern how such places are established (incorporation), how they may modify their boundaries (annexation or deannexation), and how they may be dissolved (disincorporation). The population size, geographic extent, and population density of these places vary considerably.

The U.S. Census Bureau produces estimates of the population of all governmentally active incorporated places in the United States each year. While cities, towns, boroughs, villages, and other types of municipalities are included in these estimates, for readability, the term "city" is used interchangeably with "incorporated place" throughout this report as a generic term to refer to incorporated places of all types. Though some unincorporated settlements

(those without legally formed municipal governments) may colloquially be referred to as cities, such unincorporated settlements are generally not included in this report.

NATIONAL AND REGIONAL DISTRIBUTION OF THE INCORPORATED PLACE POPULATION

Over 198.2 million people lived in incorporated places in 2013, constituting 62.7 percent of the U.S. population (Table 1, Figure 1). This was a slight increase from 62.3 percent of the U.S. population in 2010, and 61.9 percent in 2000 (Table 2). Between 2000 and 2013, the population inside incorporated places increased by 24.1 million, or about 13.9 percent. The population inside incorporated places grew faster than the total U.S. population (up 12.3 percent) over the same period (Table 1). Similar to the total population, the incorporated place population increased in every region from 2000 to 2013, and did so at faster rates in the South and West than in the Northeast and Midwest. The Northeast was the only region in which the population inside cities increased at a slower rate than the total population between 2000 and 2013, even though the Northeast's city population grew faster than the total population during the 3-year period from 2010 to 2013.

There were 19,508 incorporated places in 2013 (Table 2). The Midwest had the largest number of incorporated places of any region (8,502), followed by the South (6,576), the West (2,310), and the Northeast (2,120).

Variation in the number of incorporated places, as well as in their population, area, and density results in a

Figure 1.
**Percentage of Population in Incorporated Places
 by Region: 2013**

Source: U.S. Census Bureau, 2013 Population Estimates.

different profile of the incorporated place population for each census region. For example, while the Northeast and the West had relatively similar numbers of incorporated places in 2013, the population of incorporated places in the West was roughly twice that of incorporated places in the Northeast. This can be explained in part by the West's larger total population, as well as a higher proportion of its population living in incorporated places. Large expanses of arid and federally held land in Western states contribute to population concentration in cities. The Northeast, in contrast, contains many more smaller-sized incorporated places, as well as a large population living in densely settled unincorporated areas adjacent to large cities.

The West had the highest percentage of its population living in incorporated places (76.4 percent, Figure 1). The South, however, had

the largest number of people living in incorporated places in 2013 (64.7 million, Table 1). The South also had the largest total population of any region (118.4 million), of which about 54.7 percent lived inside incorporated places. The Northeast had the lowest percentage (51.3) of population living in incorporated places. This is partly due to the fact that towns in New England are not treated as incorporated places in Census Bureau data products. (See text box "Incorporated Places vs. Unincorporated Places.")

POPULATION IN INCORPORATED PLACES BY STATE

Reflecting the pattern exhibited at the regional level, the states with the highest percentages of their population in incorporated places tended to be located in the Midwest

and West (Figure 2).¹ Utah had the highest percentage (88.4), followed by Illinois (86.9), California (83.1), Kansas (82.7), and Minnesota (82.2).² Vermont had the lowest percentage (24.6).

This strong regional pattern reflects varying levels of urbanization, as well as differences in the total population and the number of incorporated places in each region. The West, for example, with 89.8 percent of its population living in urban areas (not to be confused with cities) in 2010, was the most urbanized of the four regions. (See text box "City vs. Urban vs. Metropolitan.") The relatively small number of incorporated places in the West reflects this greater degree of population concentration compared with the other regions. Montana stands out as an exception among Western states. A larger percentage of its population lived in rural areas (44.1 percent) compared with other states in the region, and with the region as a whole, whose population was only 10.2 percent rural. The lower percentages of population living in cities in Northeastern states such as Maine and New Hampshire, as well as Southern states such as West Virginia, are consistent with the larger proportions of their populations living in rural areas. Maine's population was 61.3 percent rural in 2010, New Hampshire's 61.1 percent, and West Virginia's 51.3 percent.

While the Midwest and South had similar rural population percentages

¹ Although there are no incorporated places in Hawaii, the Census Bureau typically includes the census designated place (CDP) of Urban Honolulu in its annual population estimates per special agreement with the state of Hawaii. Urban Honolulu CDP accounted for 24.8 percent of the state's population in 2013. (See text box "Incorporated Places vs. Unincorporated Places.")

² The District of Columbia is coextensive with the city of Washington, and is thus completely incorporated.

Table 1.

Total Population and Population in Incorporated Places by Region: 2000 to 2013

Area	April 1, 2000, Census	April 1, 2010, Census	July 1, 2013, estimate	Change, 2000 to 2013		Change, 2000 to 2010		Change, 2010 to 2013

10,000 to 24,999	1,435	1,542	1,553	22,570,012	24,179,643	24,482,834	8.0	7.8	7.7
Less than 10,000	16,772	16,570	16,494	28,737,277	28,702,036	28,643,379	10.2	9.3	9.1

¹ The number of incorporated places is as of January 1 of the calendar year. The numbers of incorporated places for the census years 2000 and 2010 include places with inactive governments that are not included in the population estimates for 2013. There were 24 inactive incorporated places in 2010. These 24 places had a combined 2010 census population of 2,984.

Source: U.S. Census Bureau, Census 2000, 2010 Census, and 2013 Population Estimates.

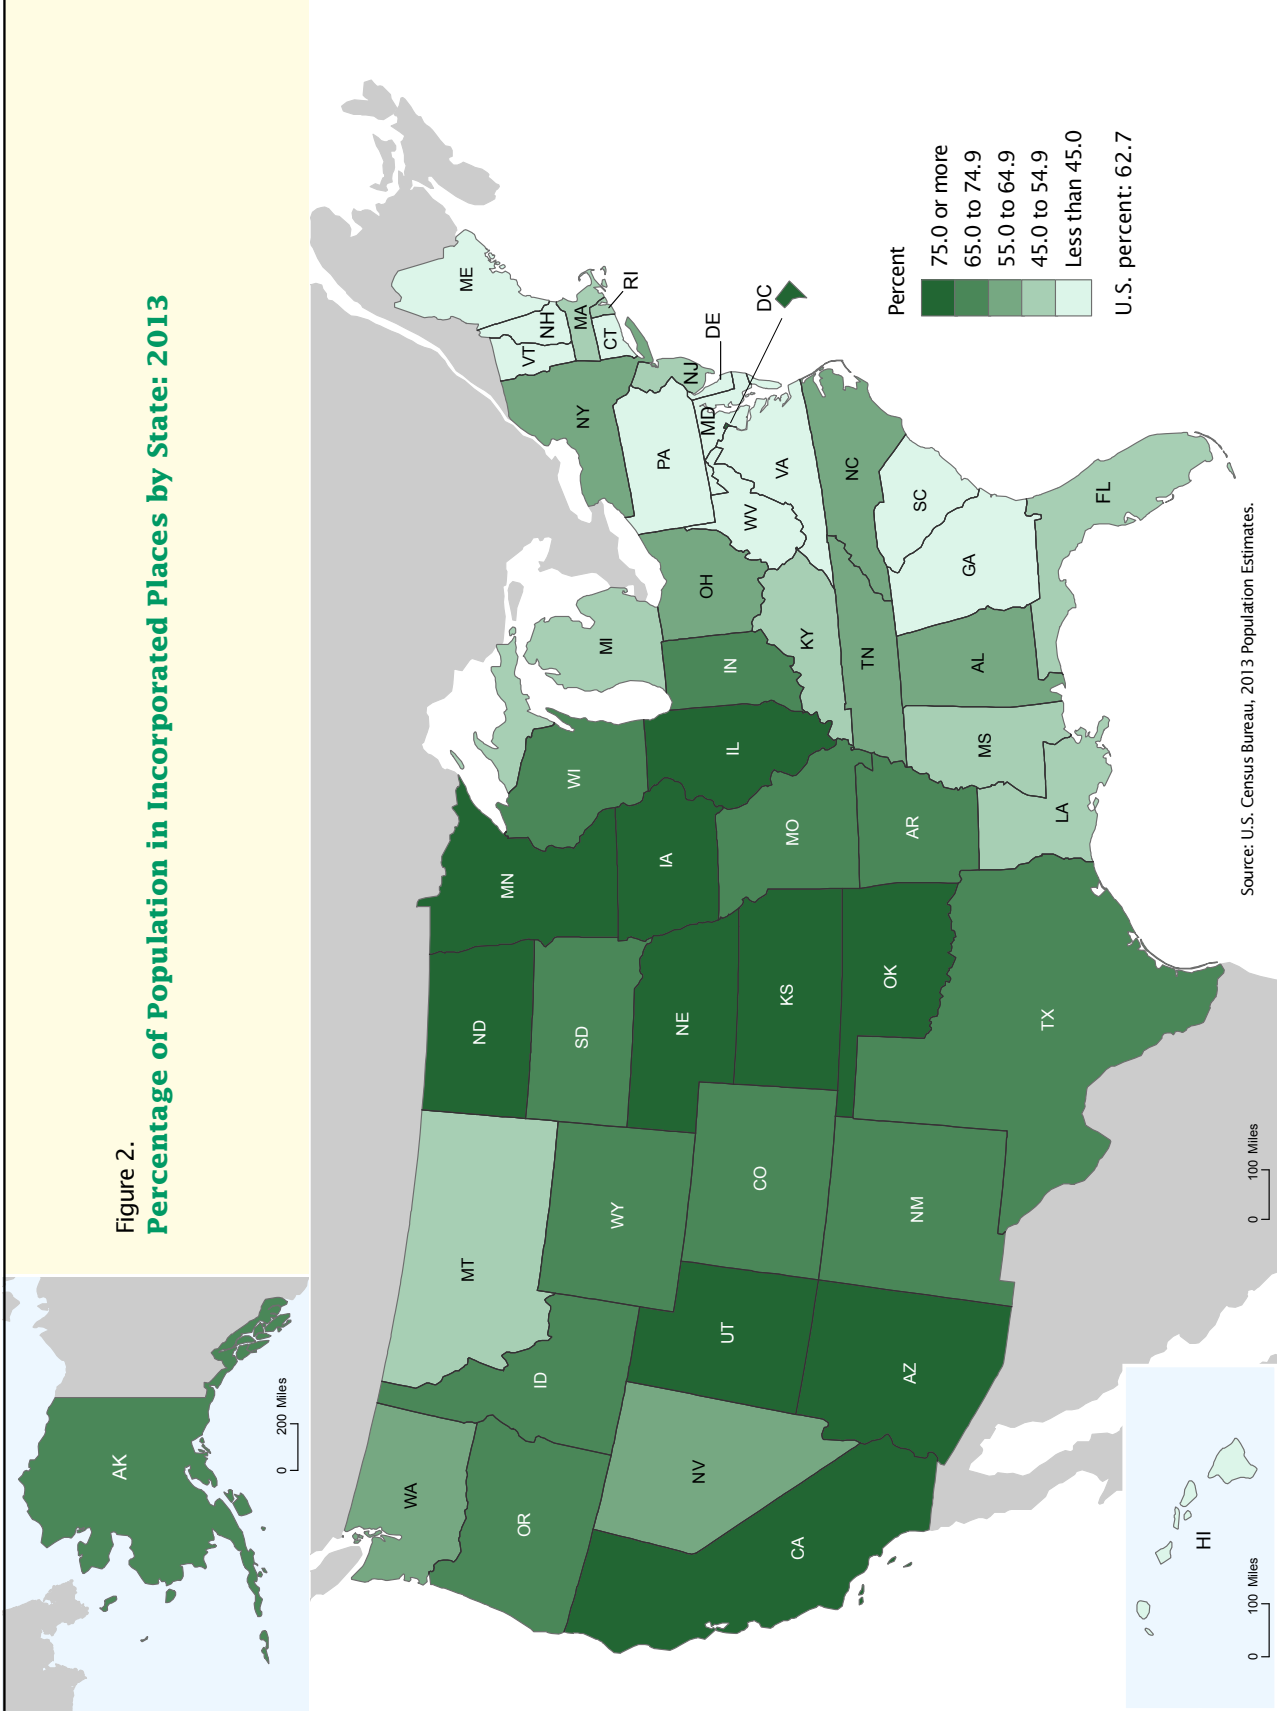

(24.1 and 24.2, respectively), the Midwest had a greater number of incorporated places, and a higher percentage of its population living in incorporated places (Figure 1). This pattern can be seen in Figure 2, which shows Midwestern states such as Iowa and Nebraska with higher percentages of their populations living in incorporated places compared to Southern states such as South Carolina and West Virginia.

POPULATION BY SIZE OF INCORPORATED PLACE

Incorporated places ranged in population from zero to more than 8 million in 2013.³ Though most of the incorporated place population (60.6 percent) lived in places of 50,000

³ While some states require a minimum population for the establishment of an incorporated place, others do not. It is therefore possible for a place to be legally incorporated even if there is no population living within its boundaries. Some such places may include only nonresidential territory, while others may have experienced population decline. A place will typically remain legally incorporated, even if its government is inactive, until the legal process of disincorporation is completed.

or more residents, the majority of incorporated places were relatively small. In 2013, 16,494 incorporated places—about 85 percent of all incorporated places—had fewer than 10,000 people (Table 2). These small places accounted for about 14 percent of the total incorporated place population, or 9.1 percent of the total U.S. population. By contrast, in 2000, cities of less than 10,000 accounted for 16.5 percent of the incorporated place population, and more than 10 percent of the total U.S. population—a higher

INCORPORATED PLACES VS. UNINCORPORATED PLACES

Incorporation is the legal procedure by which a previously unincorporated settlement forms its own municipal government, thereby creating a new incorporated place or city. These cities typically provide not only housing, but also employment, education, recreation, transportation, and other amenities. Cities also often provide police, fire, medical emergency, water, sanitation, and other such services for their residents. While some people who do not live in a city may receive such services from their township, county, or other unit of local government, many rely on a nearby incorporated place for such services. Though numerous political arrangements exist between cities and other units of local government, a city is often governmentally dependent within (i.e., legally subordinate to and overlapping in territorial jurisdiction with) a larger parent county, and in some states, a parent township (or town) within the county. The level of local government services (and taxation) provided within a city is typically higher than that of the unincorporated portions of a township or county, though this varies to some degree from state to state, and in some instances, from county to county within a state.

While the data in this report are generally limited to incorporated places (with the exception of Urban Honolulu, HI), the Census Bureau has long recognized populated settlements that are not legally incorporated. The boundaries for these unincorporated settlements are delimited by state and local officials using Census Bureau criteria, and are reviewed by Census Bureau staff for use in

Census Bureau data products. These areas are referred to as census designated places, or CDPs. When interpreting the results and analysis of incorporated places presented in this report, it is important to note that these unincorporated settlements are not included.

INCLUSION OF URBAN HONOLULU CDP

The Census Bureau is legally required to produce postcensal population estimates for general purpose governmental units, such as states, counties, minor civil divisions (towns and townships), and incorporated places. Postcensal estimates, such as the 2013 estimates used in this report, are generally not produced for CDPs. The chief exception to this convention is Urban Honolulu CDP, HI, which is included in the Census Bureau's postcensal estimates products under a special agreement with the state of Hawaii.

TREATMENT OF TOWNS IN NEW ENGLAND

Due to their often rural character, towns in New England are not regarded as incorporated places in Census Bureau data products (though some CDPs are coextensive with towns). Instead, they are recognized as minor civil divisions, much like townships in some Midwestern states. Cities, villages, and boroughs in New England are included as incorporated places in Census Bureau data products, including the 2013 estimates used in this report. When interpreting the results and analysis of incorporated places presented in this report, it is important to note that towns in New England are not included.

percentage than any other size category. The number of incorporated places with fewer than 10,000 people decreased between 2000 and 2013. The number of incorporated places of 1 million or more remained at nine, while the number of incorporated places of all other size categories increased.

Overall, the population in incorporated places grew between 2000 and 2010, and again between 2010

and 2013 (Table 3). Although the rate of population growth varied by size of place, most size categories experienced growth over both periods, with two exceptions. The population in cities of less than 10,000 decreased over both periods, and the population in cities of 25,000 to 49,999 decreased over the 3-year period between 2010 and 2013. The population in cities of 500,000 to 999,999 grew faster

than any other size category for both the 10-year and 3-year periods, as well as the 13-year period between 2000 and 2013.

MOST POPULOUS INCORPORATED PLACES

New York city remained the nation's most populous incorporated place in 2013 with 8.4 million people (Table 4), followed by Los Angeles (3.9 million), Chicago (2.7 million),

Table 3.

Population Change by Size of Incorporated Place: 2000 to 2013

Population size category	Population change					
	2000 to 2013		2000 to 2010		2010 to 2013

CITY VS. URBAN VS. METROPOLITAN

The terms city, urban, and metropolitan are often used interchangeably in popular media and common discourse. These terms, however, have very different and specific meanings when used in Census Bureau data products. Users of these products should be mindful that the territory and population denoted by these terms often overlap but are not identical.

CITY/INCORPORATED PLACE

A city is a type of incorporated place and, as noted earlier in the text, the term “city” is used generically throughout this report to refer to incorporated places of all types. A city can be partly urban and partly rural, and may be inside or outside of a metropolitan statistical area. The area and population included in a city reflect its legal corporate limits, which often do not include all of the densely settled territory of which the city forms the center. About 62.3 percent of the U.S. population lived in cities in 2010.

URBAN

An urban area as defined by the Census Bureau is a cluster of densely settled census blocks that together have a population of at least 2,500 people. These census blocks (usually the same as city blocks) generally have an aggregate population

density of at least 1,000 people per square mile. Since urban areas do not conform to political boundaries, they can contain multiple incorporated places, either in part or in their entirety. They generally include a city (or in some cases, a CDP) and its adjacent, densely settled suburbs, including both incorporated and unincorporated territory. About 80.7 percent of the U.S. population lived in urban areas in 2010.

METROPOLITAN

Metropolitan statistical areas, or metro areas, are delineated by the U.S. Office of Management and Budget (OMB). Each metro area consists of one or more counties that contain a core urban area of 50,000 or more population, plus additional counties that have a high degree of social and economic integration with the urban core. They are typically partly urban and partly rural, and can contain many cities, in whole or in part. Each metro area generally includes a large city and its nearby suburbs, as well as some sparsely settled territory that is in some degree reliant on the urban core for employment. About 83.7 percent of the U.S. population lived in metro areas in 2010 (based on OMB’s metro area definitions as of 2009).

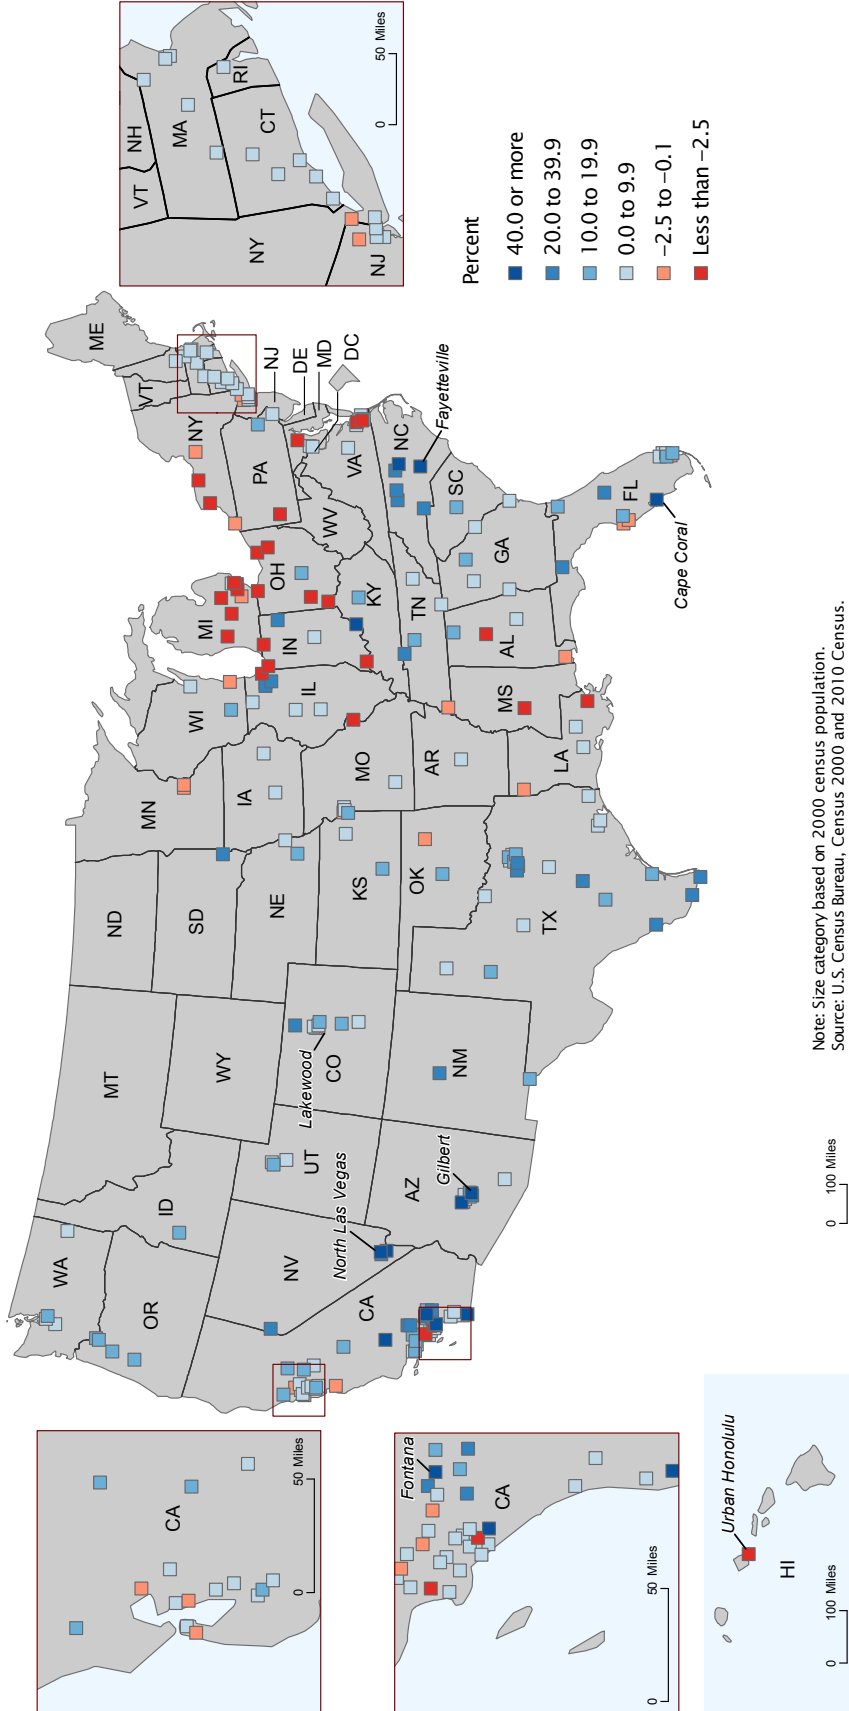

Houston (2.2 million), and Philadelphia (1.6 million). While the ten largest cities remained the same as in 2010, Austin, TX, rose from 14th largest to 11th largest, moving past San Francisco (14th), Jacksonville (13th), and Indianapolis (12th). Columbus remained ranked 15th, while Charlotte rose from 17th to 16th, moving past Fort Worth (17th). The cities ranked 18th through 20th remained the same, while Seattle moved up to 21st most populous from 23rd. Denver, which was not among the 25 most populous in 2010 (26th) ranked 22nd in 2013. Washington moved up one rank from 24th to 23rd, while Boston moved down two spots from 22nd to 24th. Nashville remained the

25th most populous. Baltimore, which ranked 21st in 2010, fell out of the top 25 to the 26th spot in 2013. Among the 25 largest cities in 2013, Austin, TX, was the fastest-growing between 2010 and 2013, followed by Charlotte, Denver, Washington, and Seattle. Consistent with the broad population growth trend exhibited at the regional level, all five of these fastest-growing large cities were in the South or the West. All five were also in the 500,000 to 1 million population size category, which was the fastest-growing between 2010 and 2013 (Table 3). Detroit was the only city among the 25 most populous that lost population between 2010 and 2013 (Table 4).

GEOGRAPHIC DISTRIBUTION OF THE FASTEST-GROWING INCORPORATED PLACES

The fastest-growing large cities—those with populations of 100,000 or more—tended to be located in the South and West (Figure 3, Table 5a, Table 5b). While all cities in this size category were located in metropolitan statistical areas (metro areas) due to their population size, many of the fastest-growing were near a larger principal city of a metro area, and some were principal cities themselves. Between 2000 and 2010, the fastest-growing large city was Gilbert, AZ (near Phoenix), with an increase of 90.0 percent; followed by North Las Vegas, NV, which grew by 87.9 percent;

Figure 3.
Percentage Change in Population for Incorporated Places of 100,000 or More:
2000 to 2010

Fayetteville, NC, which grew by 65.7 percent; Fontana, CA (near Riverside), which grew by 52.1 percent; and Cape Coral, FL, which grew by 50.9 percent.⁴

Large cities that lost population over the same period were found in every region, with a noticeable concentration in the states bordering the Great Lakes (Figure 3). Of the 52 large cities that lost population

⁴ Louisville city, Kentucky consolidated its government with Jefferson County in 2003. The 2010 population of the balance of the consolidated city (not including the smaller incorporated places that continue to exist within the county) was 597,337, which represents an increase of 341,106 or 133.1 percent from the 2000 population (256,231) of the former Louisville city.

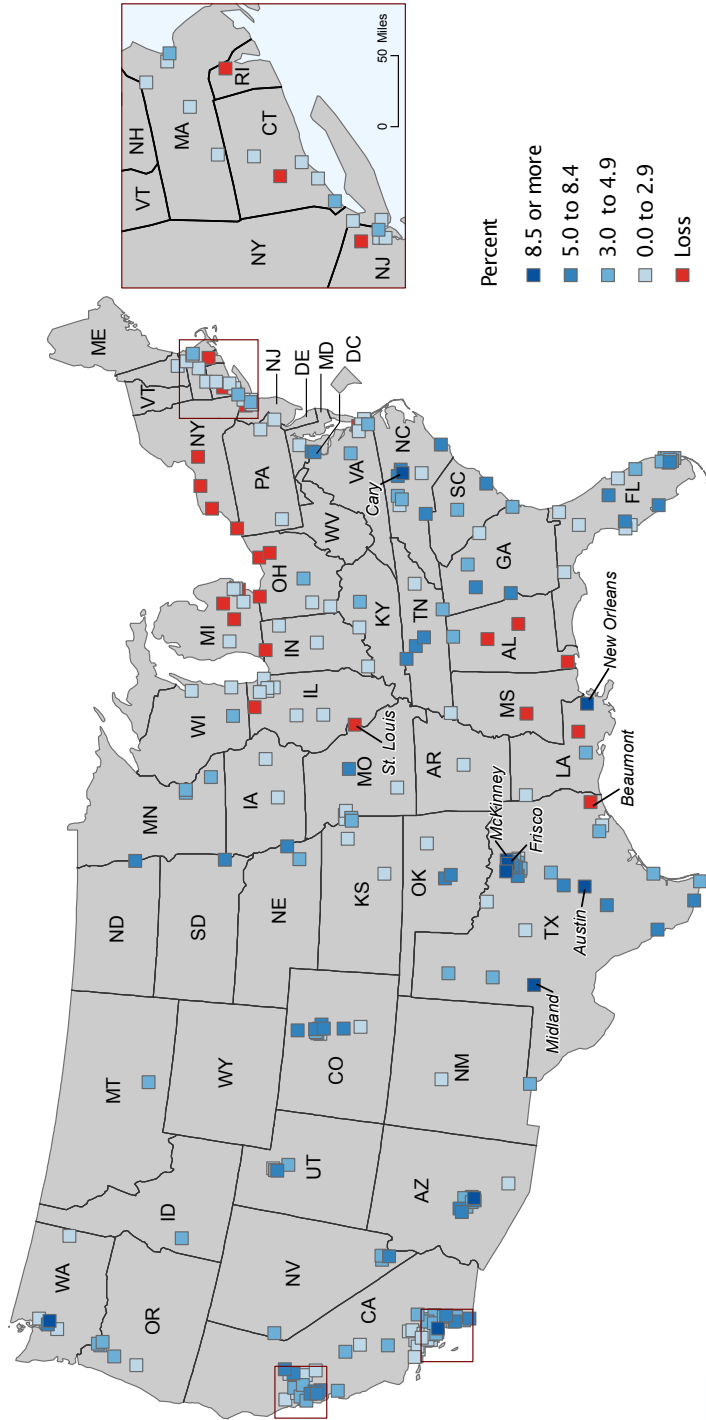

between 2000 and 2010, 7 were in the Northeast, 21 were in the Midwest, 13 were in the South, and 11 were in the West. Nine were in California, more than any other state. The other two in the West region were Lakewood, CO, and Urban Honolulu, HI, which declined due to a substantial reduction in territorial extent, as the territory of the former Honolulu CDP was split into the newly created Urban Honolulu and East Honolulu CDPs in 2010 (the 2000 data used in this report are for the former, larger Honolulu CDP).

Four of the five fastest-growing large cities between 2010 and 2013 were

in Texas. Frisco, TX, topped the list of fastest-growing large cities (16.9 percent); followed by McKinney, TX (13.3 percent); Austin, TX (12.0 percent); Cary, NC (11.7 percent); and Midland, TX (11.5 percent). Of the ten fastest-growing large cities over this period, seven were in the South and three were in the West. Cary, NC, was the only city of 100,000 or more east of the Mississippi that was among the ten fastest-growing between 2010 and 2013.

A number of large cities that lost population between 2000 and 2010 saw their populations rise between 2010 and 2013, most notably New Orleans, which grew by

10.1 percent (Table 5b, Figure 4).⁵ In fact, nearly all large cities west of the Mississippi grew between 2010 and 2013. Only two—Beaumont, TX, and St. Louis, MO—lost population during that period (Figure 4).

The ten fastest-growing cities of 50,000 to 99,999 were all in the South or West for both the 10-year period from 2000 to 2010, and the 3-year period from 2010 to 2013. Three of the ten fastest-growing over the 10-year period were in California, more than any other state (Table 6a). For the 3-year

⁵ New Orleans had lost a considerable percentage of its population between 2000 and 2010 due to the impact of Hurricane Katrina.

period, Washington, Texas, and Arizona each had two cities among the ten fastest-growing in this size category (Table 6b).

Plainfield, IL, a suburb of Chicago, stood out as the only Midwestern city among the ten fastest-growing of 10,000 to 49,999 between 2000 and 2010 (Table 7a). The other nine fastest-growing cities in this size category for the 10-year period were all in the South or West. Two Midwestern cities—Zionsville, IN (near Indianapolis), and Williston, ND—were among the ten fastest growing in this size category for the 3-year period between 2010 and 2013 (Table 7b). Zionsville, which grew by 77.4 percent, was the

fastest growing overall in this size category over the 3-year period.⁶ Williston was one of the few cities among the fastest-growing that was not in a metro area.

LAND AREA AND POPULATION DENSITY

While incorporated places included a majority of the U.S. population, only a small fraction of the U.S. land area (about 3.5 percent) was in incorporated places in 2013. Due to their nature as areas of population

⁶ Princeton borough, New Jersey, consolidated its government with Princeton township in 2013. The 2013 population of the consolidated borough and township was 29,008, which represents an increase of 16,701 or 135.7 percent from the 2010 population (12,307) of the former Princeton borough.

Source: U.S. Census Bureau, 2013 Population Estimates.

concentration, incorporated places are much more densely populated (1,593.5 people per square mile, in aggregate) than the territory outside incorporated places (34.6 people per square mile). As Table 8 shows, population density was generally higher among the largest cities, and lower among the smallest ones. In particular, cities of 1 million or more population were considerably more dense (by a difference of more than 4,000 people per square mile, in aggregate) than cities of less than 1 million. Similarly, cities of fewer than 10,000 were considerably less dense (by a difference of more than 1,600 people per square mile, in aggregate) than cities of 10,000 or more.

While most incorporated places were less than 50 square miles in land area, a few were more than ten times that size. Cities that were largest in land area in 2013 tended to be

located in Western states (particularly Alaska), and to a lesser extent, the South. Four of the five largest were located in Alaska, each with an area of over 1,700 square miles (Table 9).⁷

Several cities that have consolidated governments with their parent counties also rank among the largest in land area. Of the 11 cities of 500 square miles or more, 8 of them (also the eight largest in land area, each being over 700 square miles) were city/county consolidations, or—in the case of Anchorage—county equivalents. Oklahoma City, at 606.7 square miles, was the largest city in land area that was not a city/county consolidation or

⁷ Much of Alaska's very large area is sparsely populated, and the relatively few units of local government that exist are responsible for administering services to relatively large territories. Note the large area compared to the relatively small population size and low population density levels in cities such as Juneau, Sitka, and Wrangell (Table 9).

county equivalent. Phoenix and Houston were the only other cities of 500 or more square miles that were not city/county consolidations or county equivalents. Houston had the largest population of any city of more than 500 square miles. Of the 25 largest cities in land area, only 4 had a 2013 population estimate of fewer than 10,000 people. Fifteen of the 25 had population density values of more than 1,000 people per square mile. Only one, Los Angeles, had a population density of more than 5,000 people per square mile (Table 9).

New York, with a population density of 27,781.2 people per square mile, was the nation's densest large city by a considerable margin, followed by San Francisco (17,858.9); Jersey City, NJ (17,396.0); Paterson, NJ (17,316.5); and Cambridge, MA (16,790.7) (Table 10). These dense

Table 10.

large cities include older port cities and their nearby suburbs. Cities in California also feature prominently among the most dense, accounting for 9 of the 25 densest large cities, more than any other state. Of the 25 densest large cities, 11 were in the Northeast, 1 (Chicago) was in the Midwest, 4 were in the South, and 9 were in the West (Table 10).

Table 11 shows large cities that had the largest increases or decreases in population density between 2010 and 2013. Increases in density result from population gains unaccompanied by a commensurate gain in land area. Infill development, conversion of nonresidential land for residential use, and redevelopment from low-rise to high-rise residential

structures are common processes that can increase population density. Older coastal cities (e.g., New York, San Francisco, Boston) were among the large cities whose population density values increased the most between 2010 and 2013. Most of these cities had stable land area over the period.

Decreases in density result from either population loss or from gains in land area that outpace gains in population. Several Midwestern cities (Des Moines, IA; Detroit; Evansville, IN; Lansing, MI; and Rockford, IL) were among those with the largest decreases in population density (Table 11). While some cities' density levels declined due to

population loss (e.g., Detroit and Rockford, IL), others (e.g., Modesto, CA, and Spokane, WA) lost density due to increases in land area. Of the ten cities of 100,000 or more with the largest declines in population density, only Detroit did not have an increase in land area.

ANNEXATION

Though expansion of municipal boundaries via annexation is uncommon in the Northeast, it is a fairly common practice in the South and the West, and in some parts of the Midwest. Not surprisingly, Southern, Western, and Midwestern cities topped the lists of incorporated places that had the largest annexations between 2010 and

MEASURING THE IMPACT OF ANNEXATION

Annexation is the legal procedure by which an incorporated place modifies its boundaries through the addition of new territory. The process varies considerably by state, and is generally more common in the South and West. It is less frequent in the Northeast, and particularly rare in New England.

2013 ESTIMATES BASE POPULATION

In this report, the impact of annexation is measured by comparing the results from the 2010 Census with a retabulation of those results in 2013 boundaries. This retabulation, referred to as the estimates base (Table 13), shows what the 2010 population of an area would have been had the

area's 2013 boundary been in place at the time of the census. The difference between the original census population and the estimates base population for an incorporated place provides a measure of the impact of annexation on the place's population by approximating the 2010 population of the territory annexed between 2010 and 2013. The estimates base population reflects official boundary changes collected via the Census Bureau's annual Boundary and Annexation Survey, as well as other enhancements to the Census Bureau's geographic and address database. Official corrections to the census processed via the Count Question Resolution program are also included in the estimates base.

2013. Caliente, NV, (a small city in Lincoln County), had the largest increase in land area (Table 12), while Kirkland, WA, annexed the area with the largest 2010 population (Table 13). Zionsville, IN (a suburb of Indianapolis), stood out as having annexed territory that was among the largest in both land area and population. As Table 13 shows, in some cities (e.g., Kokomo, IN), annexation appeared to be a major contributor to population growth, as suggested by a 2013 population that was not much higher than the 2010 population in the 2013 boundary. In other cities (e.g., Austin, TX), demographic components of population change (i.e., natural increase or migration) contributed to population growth in addition to annexation—as evidenced by a 2013 population that was notably higher than the 2010 population in the 2013 boundary.

Among cities of 100,000 or more population, those with the largest percentage increases in land area between 2000 and 2013 tended to be located in the South and West,

and in some parts of the Midwest (Figure 5). With the exception of Louisville, KY, which consolidated its government with Jefferson County in 2003, the cities of 100,000 or more with the largest percentage gains in land area between 2000 and 2013 were: Fayetteville, NC (149.1 percent); Brownsville, TX (64.7 percent); Joliet, IL (64.7 percent); Gilbert, AZ (57.9 percent); and Reno, NV (55.1 percent).

Most cities in the Northeast and in the Midwestern states of Ohio and Michigan had relatively stable boundaries between 2000 and 2013. This regional pattern partly reflects variation in annexation laws by state. While some states allow cities to annex unilaterally (without consent of the population living in the area to be annexed), others require multilateral consent, often in the form of a referendum voted on by the residents of the area being annexed.

NEW INCORPORATIONS

While the number of incorporated places was relatively stable from 2010 to 2013, there were 16 new incorporations during the period (Table 14), and 1 place (Jane, MO) that newly reported its existence to the Census Bureau, despite having incorporated several years earlier.⁸ Collectively, these incorporated places had a total 2013 population of 307,191. Their individual 2013 populations ranged from 208 (Sandy Point, TX) to 98,030 (Jurupa Valley, CA). Four were in the West, eight in the South (three in Texas alone), four (including Jane, MO) in the Midwest, and one (Mastic Beach, NY) in the Northeast. One new entity (Greeley County unified government, KS) formed from the consolidation of a previously existing incorporated place with its parent county.

⁸ There were 3 incorporated places that became inactive between 2010 and 2013, and 24 that disincorporated, including 1 (Foster city, Kentucky) that was inactive in 2010.

Table 13.

Incorporated Places With Largest Increase in 2010 Population Due to Boundary Change: 2010 to 2013

Incorporated place	April 1, 2010, Population			July 1, 2013, population estimate
	In 2010 boundary (census)	In 2013 boundary (estimates base) ¹	Increase due to boundary change	
Kirkland city, Washington	48,787	80,583	31,796	84,430
Kent city, Washington	92,411	118,590	26,179	124,435
Austin city, Texas	790,390	810,759	20,369	885,400
Burien city, Washington	33,313	48,072	14,759	49,858
Kokomo city, Indiana	45,468	56,842	11,374	56,895
Zionsville town, Indiana	14,160	23,319	9,159	25,115
Omaha city, Nebraska	408,958	416,969	8,011	434,353

Percentage Change in Land Area for Incorporated Places of 100,000 or More:
2000 to 2013**

SUMMARY

The U.S. population remains increasingly concentrated in incorporated places, more so in the West than in any other region. Incorporated places are as diverse in their characteristics as the United States, varying considerably in population size, geographic extent, and patterns of growth and decline. These patterns can be affected by physical geographic conditions, demographic trends, and legal or political factors, such as the ability to annex additional territory.

Incorporated places grew faster than the United States as a whole from 2000 to 2010, and from 2010 to 2013. Cities in the South and West grew faster than those in the Midwest and Northeast. Larger cities (of 100,000 or more population) grew faster than smaller ones between 2000 and 2013, with cities of 500,000 to 999,999 growing the fastest. Cities among the ten fastest-growing across all size categories tended to be located in metro areas.

Cities with larger populations tended to be more dense than smaller cities. Several large cities with stable boundaries (e.g., New York, Washington, San Francisco)

experienced population growth between 2010 and 2013, resulting in increased density levels. While density levels in some cities fell due to population decline (e.g., Detroit), some cities that experienced population growth saw their density levels decline due to increased land area via expansion of their municipal boundaries (e.g., Modesto, CA).

Expansion of city boundaries via annexation was more common in the South, West, and Midwest, but almost nonexistent in the Northeast, as was the establishment of new incorporated places. More cities incorporated in the South between 2010 and 2013 than in any other region. Three new cities incorporated in Texas, more than any other state. While more than one-third of the U.S. population lives outside incorporated places, America continues to be mainly a nation of cities.

METHODOLOGY AND SOURCES OF DATA

The data used in this report include 100 percent counts of the total population from the 2000 and 2010 censuses, as well as postcensal estimates of the total population for July 1, 2013. For information about the Census Bureau's methodology

for producing the 2013 population estimates for incorporated places, see <www.census.gov/popest/methodology/2013-su-meth.pdf>.

Potential sources of nonsampling error in the population estimates process include: (1) potential errors (such as differential undercoverage or overcoverage by demographic characteristics) in the enumeration (e.g., the previous decennial census) that serves as the base of the postcensal estimates; and (2) potential errors in the components of change (such as births, deaths, domestic migration, and net international migration) used to carry forward the population estimates.

For information on confidentiality protection, nonsampling error, and definitions for decennial census data, see <www.census.gov/prod/cen2010/doc/sf1.pdf>.
