8. Marital status, by household headship, age, race, and sex, for regions: March 1971.	25
9. Distribution by marital status, and mean age at first marriage, for males 25 to 64 years old, by years of school completed, income in 1970, and age: March 1971.	28
10. First marriages in 1965 to 1970 per 1,000 single persons, by age at beginning of year and sex: March 1971.	34
11. First marriages in 1969 and 1970 per 1,000 single persons 14 to 44 years old, by selected characteristics: March 1971.	34
12. Persons 18 years old and over, by age at first marriage, age at survey date, race, and sex: March 1971	35
13. Difference between ages of husband and wife at survey date, by age at first marriage and years since first marriage of wife: March 1971.	38

Marital Status and Living Arrangements: March 1971

The majority of the divorced men and women in the United States in March 1971 maintained their own households (cover chart and table A). However, a much higher proportion of divorced women, about 79 percent, were household heads than was the case among divorced men, about 56 percent. Furthermore, about five times as great a proportion of divorced women than men were household heads with children or other relatives present, although relatively more men were listed as household heads with no relatives present (primary individuals). Most of the primary individuals of both sexes were living alone.

Table A. LIVING ARRANGEMENTS OF DIVORCED PERSONS BY SEX: MARCH 1971

Living arrangements	Male	Female
Total, 14 years old and over....thousands..	1,829	2,829
Percent.....	100.0	100.0
Head of household.....	55.8	79.2
Head of primary family....	9.1	49.4
Primary individual.....	46.7	29.8
Living alone.....	42.4	27.7
Nonrelatives present.....	4.3	2.0
Not head of household.....	44.2	20.8
In families.....	20.4	16.3
Secondary individuals.....	13.1	3.4
Inmates.....	10.7	1.1

About 21 percent of all divorced women were not household heads, with a substantial majority living with relatives in families and a minority (4 percent) living apart from relatives, both as secondary individuals and as inmates of institutions. By contrast, about 44 percent of the divorced men were not heads of households, and more (24 percent) lived either as secondary individuals or inmates than were residing in families (20 percent).

The data presented in this report for 1971 were derived from the Current Population Survey conducted by the Bureau of the Census and are subject to sampling variability, which may be relatively large for the smaller figures and for small differences between figures. For further

discussion of the sampling variability, see the section on "Reliability of the estimates."

PERCENT SINGLE FOR YOUNGER PERSONS RISES

Since 1960 there has been a change in the percent single among both men and women under the age of 35 in the United States. This change shows a higher proportion of men and women remaining single within this age range. The percent single among men under 35 years old had increased by about 5 percentage points between 1960 and 1971, while the proportion single among women of the same age had increased by nearly 8 percentage points (table B). These results may reflect an increasing tendency for young persons to delay marriage for various reasons until later years, or a newly developing tendency for more of the young persons of today to remain single for their entire lives.

By contrast, since 1960 the percent single in the age group 35 years old and over has continued a long-time tendency to decrease. Thus, the proportion of persons in this age group who remain unmarried had declined for both men and women in the last decade. Additional evidence is provided by the increase in the median age at marriage for both sexes since 1960 as shown in table C.

Since this increase in the percent single among young persons is a relatively recent phenomenon, it will be necessary to observe a young cohort for several years, for example, those persons currently 20 to 24 years old, to see how they react overall in terms of their disposition to marry in later years. These further observations will be necessary to determine whether or not (1) people are delaying marriage for a certain number of years, but still eventually marry in similar or greater proportions than before, or (2) more people are simply not going to marry regardless of age, or (3) this is a cyclical phenomenon which will eventually alternate with a pattern of more people marrying at younger ages than is now the case.¹

¹See 1950 census data on high proportions of single persons at young age levels; 1950 Census of Population, Volume II, Characteristics of the Population, United States Summary, table 104.

LIVING ARRANGEMENTS OF PERSONS 65 YEARS OLD AND OVER

In March 1971 there were an estimated 8.5 million men and 11.6 million women in the United States who were 65 years old and over. These figures represent an increase over the past 10 years of about 1.3 million men and about 2.8 million women. Nearly 80 percent of the men and 58 percent of the women in this age group were members of families in 1971 (table E) with about 73 percent of all the men living as family heads and 34 percent of all the women living as wives of family heads. These latter proportions were about the same in 1961 while the overall proportion of men and women living in families had decreased somewhat since 1961. This decrease in the proportion of men and women living in families seems to be

principally reflected in the decrease observed in the category "other relative," those persons who resided in families but were neither heads nor wives of heads of the families in which they lived. About 11 percent of all men 65 years old and over were "other relatives" in families in 1961; by 1971 this figure had dropped to about 7 percent. Similarly, among women there were an estimated 22 percent of the population who were classified "other relatives" in families in 1961, a proportion which decreased to about 15 percent by 1971.

Since 1961 there has been an increase in the proportion of men and women 65 years old and over who maintained their own households in a nonfamily situation. These primary individuals represented about 15 percent of the men 65 years old and over and about 36 percent of the women in March 1971. The corresponding figures for 1961 were about 12 percent for men and 28 percent for women. Primary individuals are persons who maintain their own households while living apart from any relatives. About 96 percent of all primary individuals 65 years old and over occupied their own house or apartment entirely alone as "one-person households" in 1971 (table 6).

RELATED REPORTS

Figures for 1970 on marital status and family status were issued in Series P-20, No. 212. Figures on projections for the United States of the number of households and families from 1967 to 1985 have been published in Series P-25, No. 394. Additional statistics for years since 1947 on subjects covered in this report have been published by the Bureau of the Census in other reports in Series P-20.

Statistics on marital status for 1960 for standard metropolitan statistical areas, counties, urbanized areas, cities, States, regions, and the United States are presented in 1960 Census of Population, Volume 1, Characteristics of the Population, chapter B, "General Population Characteristics." Detailed statistics on marital status and presence of spouse by age for 1960 for States and for large counties and standard metropolitan statistical areas are available in Volume I, chapter D, "Detailed Characteristics." Similar data for the United States and regions have been published in 1960 Census of Population, Volume I, Characteristics of the Population, Part 1, United States Summary. The 1960 census report Series PC(2)-4B, Persons by Family Characteristics, presents statistics on the marital and family status of persons 14 years old and over, by age, race, and sex, for the United States as a whole and for urbanized areas, and on persons under 14 years old by presence and marital status of parents, for the United States by type of residence, and for the South. In addition, this report shows all family members by age, sex, and family relationship, by characteristics of the families of which they are members, including size of family, number of children, and education, occupation, and income of the family head.

The 1960 census report Series PC(2)-4E, Marital Status, shows detailed statistics on the marital status distribution of the population 14 years old and over by selected social and economic characteristics for the United States. Series PC(2)-4D, Age at First Marriage, shows detailed statistics for the United States on characteristics of persons 14 years old and over by age at first marriage, based on answers to questions on date of first marriage. In addition, the report shows average annual rates of first marriage per 1,000 single persons 14 to 44 years old in 1958 and 1959, for States. Statistics for 1960 on women by marital status, number of children ever born, and age at first marriage, are shown for the United States in Series PC(2)-3A, Women by Number of Children Ever Born.

DEFINITIONS AND EXPLANATIONS

Coverage. The population in this report includes the civilian population of the United States plus approximately 1,164,000 members of the Armed Forces in the United States living off post or with their families on post in 1971, but excludes all other members of the Armed Forces. However, the data in tables C and D on median and quartile ages at first marriage for males refer to the total male population, which includes, in addition to the above, the male members of the Armed Forces overseas and in military barracks and similar quarters in the United States.

Conterminous United States. Conterminous United States is that part of the United States having a common boundary, i.e., the United States exclusive of Alaska and Hawaii.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The territory classified as urban in this survey is the same as that in the 1960 census; all other territory is classified as rural. The method of determining farm-nonfarm residence in the Current Population Surveys since March 1960 is the same as that used in the 1960 census, but differs from that used in earlier surveys and censuses. According to the current definition, the farm population consists of all persons living in rural territory on places of less than 10 acres yielding agricultural products which sold for \$250 or more in the previous year, or on places of 10 acres or more yielding agricultural products which sold for \$50 or more in the previous year. Rural persons in institutions, motels, and tourist camps, and those living on rented places where no land is used for farming, are not classified as farm population. The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: white, Negro, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except white and Negro. "Other races" are usually shown in combination with the Negro population.

Marital status. The marital status classification identifies four major categories: single, married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, spouse present," "separated," and "other married, spouse absent." A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group "other married, spouse absent" includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, was residing in an institution, had moved to another

area, or had a different place of residence for any other reason except separation as defined above.

Husband in Armed Forces. When a woman was reported as married but her husband was not enumerated as a member of the same household or group quarters, an additional question was asked to determine whether her husband was in the Armed Forces. Women who were reported as separated were not asked the additional question.

Age at first marriage. The median age at first marriage, as shown in this report, is an approximation derived indirectly from tabulations of marital status and age. In computing this median, several steps are involved. First, the expected proportion of young people who will ever marry during their lifetime is computed. Second, one-half this expected proportion is calculated. And third, the current age of young people who are at this halfway mark is computed. From the assumptions made and the procedures used, it follows that the date of the survey is also the date when this halfway mark is reached. Half of the young people of the given age who will ever get married had done so prior to the survey date and half are expected to marry in years to come.

The quartile ages at first marriage divide people who will ever marry into four equal groups. The first quartile age is the age at which 25 percent of persons have married, the second quartile age (or median age) is the age at which 50 percent of persons have married, and the third quartile age is the age at which 75 percent of persons have married. The quartile ages are computed from the same distributions and involve the same assumptions as do the median ages.

In estimating the proportion of young people who will eventually marry, errors of 3 or 4 percentage points would affect the final estimate of the median age at first marriage by only 0.1 or 0.2 of a year. For convenience, the proportion ever married among persons 45 to 54 years old was used. Other age combinations could have been used with little change in the results, so long as they included very few persons who would subsequently marry for the first time.

Data on marital status were available by single years of age in censuses and by 5-year age groups in the sample surveys. Sprague's fifth difference interpolation formula was used to estimate the percent ever married by tenths of a year of age from census figures and from the sample survey data. Since the interpolation was based on the percent ever married for 5-year age groups in the survey data, and since this percent is sensitive to changes in the distribution by single years of age within the

age groups when most first marriages take place, the resulting median age at first marriage from the survey may fluctuate sharply in response to the major changes that have recently taken place in the age composition of the 20- to 24-year-old age group. The effect is marked in the case of the median age of men at first marriage because this median falls near the center of a 5-year age group. The median age of women at first marriage is relatively unaffected because little interpolation is required for its calculation; this median is now close to exact age 20, which is the lower limit of the age group.

The median age at first marriage computed from data on either annual marriage records or census questions on age at first marriage involves people over the full age span rather than just those in the vicinity of the halfway point. Median ages at first marriage based on these other records may be affected by changes in the age distribution of the population, whereas the median age at first marriage for a given date shown in the present report can be interpreted as applying to the cohort born "n" years earlier, where "n" is the median age at first marriage. Data on age at first marriage are available from marriage records only for certain States and from census questions only for selected dates.

When the figures on median and quartile ages at first marriage for different years are compared, caution should be exercised in the interpretation of small changes. Because of sampling variability of the survey data and the limitations of the estimating technique itself, the errors in the estimates of the median age may be slightly larger than annual changes of one- or two-tenths of a year of age. Moreover, there is evidence that computation of the median age at first marriage for men in some years is affected by changes in the distribution by single years of age within the age groups when most first marriages take place; changes of up to one-half year in the median for men may reflect this factor rather than any real change taking place in the ages of men at first marriage.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such

as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. Group quarters are living arrangements for institutional inmates, regardless of the number of inmates, or for other groups containing five or more persons unrelated to the person in charge. (See discussion of secondary families in the following section.)

Family status. Within households, persons who are family members are distinguished from those who are not family members. A family is defined as a group of two or more persons residing together who are related by blood, marriage, or adoption; all such persons are considered as members of one family even though they may include a "subfamily," that is, a married couple or a parent-child group sharing the living quarters of the family head. A primary family includes among its members the head of a household, and a "secondary family" includes no member related to the household head. Members of secondary families may include persons such as lodgers, guests, or resident employees and their relatives living in a household.

Persons living with relatives in group quarters were formerly considered as members of secondary families. However, the number of such families became so small (37,000 in 1967) that beginning with data for 1968 (and beginning with the census data for 1960) the Bureau of the Census includes persons in these families in the count of secondary individuals.

Persons who are not family members (that is, are not recognized as living with any relatives) include "unrelated individuals" and inmates of institutions. Unrelated individuals are of two types--primary and secondary. A "primary individual" is a household head with no relatives in the household. A "secondary individual" is a lodger, partner, guest, or resident employee with no relatives in the household or group quarters (and not a household head or institutional inmate).

Inmates of institutions are persons, other than resident employees, in such places as homes for delinquent or dependent children, homes and schools for the mentally or physically handicapped, places providing specialized medical care, homes for the aged, prisons, and jails.

Income. For the noninstitutional population 14 years old and over, questions were asked on the amount of money income received in 1970. The amounts received represent income before deductions for personal taxes, Social Security,

bonds, etc. Although the income statistics refer to receipts during 1970 the characteristics of the person, such as age, marital status, etc., refer to March 1971.

Years of school completed. In this report data on years of school completed were derived from the combination of answers to two questions, (a) "What is the highest grade of school that he has attended?" and (b) "Did he finish this grade?"

The questions on educational attainment applied only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, "regular" schooling is that which advances a person toward an elementary or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data for 1971. The estimates are based on data obtained monthly in the Current Population Survey of the Bureau of the Census. The sample is spread over 449 areas comprising 863 counties and independent cities, with coverage in each of the 50 States and the District of Columbia. Approximately 50,000 occupied housing units are eligible for interview each month. Of this number, 2,250 occupied units, on the average, are visited but interviews are not obtained because the occupants are not found at home after repeated calls or are unavailable for some other reason. In addition to the 50,000 there are also about 8,500 sample units in an average month which are visited but are found to be vacant or otherwise not enumerated.

The estimating procedure used in this survey involved the inflation of weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from the 1960 Census of Population; statistics of births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. To these figures were added the members of the Armed Forces living off post or with their families on post and the institutional population. The estimated numbers of inmates of institutions shown in this report were obtained by assuming that the percent of population who were inmates in each age and sex group in 1971 was the same as in the 1960 census.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Reliability of the estimates. Since the estimates are based on a sample, they may differ somewhat from the figures obtained if a complete census had been taken using the same schedules, instructions, and enumerators. As in any survey work, the results are subject to errors of response and of reporting as well as being subject to sampling variability.

The standard error is primarily a measure of sampling variability, that is, of the variations that occur by chance because a sample rather than the whole of the population is surveyed. As calculated for this report, the standard error also partially measures the effect of response and enumeration errors, but does not measure as such any systematic biases in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census figure by less than the standard error. The chances are about 90 out of 100 that the difference would be less than 1.6 times the standard error and about 95 out of 100 that the difference would be less than twice the standard error.

All statements of comparison appearing in the text are significant at a 1.6 standard-error level or better. Most are significant at a level of more than 2.0 standard errors. Thus, for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by the use of the phrase "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

The figures presented in tables F, G, H, and I are approximations to the standard errors of various estimates shown in this report. In order to derive standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of

approximations were required. As a result, the tables of standard errors provide an indication of the order of magnitude of the standard errors rather than the precise standard error for any specific item.

Table F contains the standard error of estimates of the number of persons in a given class. Table G contains the standard error of estimates of the number of households or families in a given class. Table G should also be used for items which can typically appear only once in a given household as, for example, "Number of Married Women," or "Number of Married Men."

Table G. STANDARD ERRORS OF ESTIMATED NUMBERS OF HOUSEHOLDS AND FAMILIES

(68 chances out of 100)

Size of estimate	Standard error	Size of estimate	Standard error
20,000.....	4,000	500,000....	22,000
30,000.....	5,000	1,000,000..	31,000
40,000.....	6,000	2,500,000..	47,000
50,000.....	7,000	5,000,000..	64,000
100,000.....	9,000	10,000,000.	87,000
250,000.....	16,000	25,000,000.	110,000

The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more.

Table H shows the standard errors of estimated percentages of persons for different sizes of the bases of the percentages. Table I shows the standard errors of estimated percentages of households or families. The guidelines used to decide whether table F or table G is appropriate for a particular item should also be used for deciding between the use of tables H and I.

Illustration: Table 1 shows that at the time of the survey there were 3,362,000 married males age 20 to 24. Table G shows the standard error of an estimate of this size to be approximately 53,000. The chances are 68 out of 100 that the estimate would have shown a figure differing from a complete census by less than 51,000. The chances are 95 out of 100 that the estimate would have shown a figure differing from a complete census by less than 106,000 (twice the standard error).

Of these 3,362,000 married males, 3,184,000 or 94.7 percent were living with their wife. Table I shows the standard error of 94.7 percent on

Table F. STANDARD ERRORS OF ESTIMATED NUMBERS OF PERSONS

(68 chances out of 100)

Size of estimate	Standard error	Size of estimate	Standard error
20,000.....	6,000	1,000,000..	39,000
30,000.....	7,000	2,500,000..	64,000
40,000.....	8,000	5,000,000..	82,000
50,000.....	9,000	10,000,000.	115,000
100,000.....	12,000	25,000,000.	160,000
250,000.....	20,000	50,000,000.	189,000
500,000.....	28,000		

a base of 3,362,000 to be approximately 0.4 percent. Consequently, chances are 68 out of 100 that the estimated 94.7 percent would be within 0.4 percentage points of a complete census figure, and chances are 95 out of 100 that the estimate would be within 0.8 percentage points of a census figure, i.e., this 95 percent confidence interval would be 93.9 to 95.5 percent.

Note when using small estimates. Percentage distributions are shown in this report only when

the base of the percentage is greater than 75,000. Because of the large standard errors involved, there is little chance percentages would reveal real information when computed on a smaller base. Estimated totals are shown, however, even though the relative standard errors of these totals are larger than those for the corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's needs.

Table H. STANDARD ERRORS OF ESTIMATED PERCENTAGES OF PERSONS

(68 chances out of 100)
