# Market Absorption of Apartments 

U.S. Department of Commerce bureau of The census

U.S. Department of Housing<br>and Urban Development

ANNUAL: 1976 ABSORPTIONS

H-130-76-5
(Completions in 1975)
Issued May 1977

During 1975, completions of privately financed, nonsubsidized and unfurnished apartments in buildings of 5 units or more totaled about 216,500 . Of these, 70 percent were rented within the first 3 months of completion, 85 percent were rented within 6 months, and 95 percent within 12 months.

Forty-nine percent of these new apartments had 2 bedrooms, while those with less than 2 were about the same at 45 percent, and 6 percent had 3 bedrooms or more. Monthly rents for 7 percent of the new units had rents of less than $\$ 150$. Those renting for $\$ 150$ to $\$ 199$ accounted for 37 percent and those renting for $\$ 200$ or more accounted for 56 percent of the total (see table 1). Two out of 3 ( 68 percent) included swimming pools in rental payments, and 1 out of 2 ( 52 percent) included air conditioning at no extra cost (see table 3 ).

Three months after completion of these apartments, the absorption rates were generally lower for units with higher rents. Of the apartments renting for less than $\$ 125$, approximately 86 percent were rented within 3 months, while those renting for $\$ 250$ or more had an absorption rate of 58 percent within the same period. The absorption rates for the higherpriced units remained generally lower than for the less expensive units as their market exposure continued.

The majority ( 91 percent) of these unfurnished apartments were constructed inside standard metropolitan statistical areas, with 53 percent located outside central cities and 38 percent inside central cities. Regional differences were apparent. A regional comparison of the total shows that two-fifths (41 percent) were built in the South, compared to the Northeast region in which 14 percent were built. Figures for the North Central were 25 percent built compared to the West region in which 20 percent were built (see table 2).

The data are based on a sample survey and consequently the figures cited above are subject to sampling variability. Sampling errors (i.e., standard errors) for the figures that follow are indicated in parentheses. ${ }^{1}$ These standard errors imply there are

[^0]about 2 chances out of 3 that a complete count would be contained in the interval around the estimate defined by the standard error.

Throughout all of 1975 a total of about 360,700 privatelyfinanced apartments were completed in buildings with 5 or more units, of which 60 percent ( $\pm 1.2$ percentage points) were nonsubsidized unfurnished apartments. Of the remainder, 23 percent ( $\pm 1.0$ percentage points) are cooperatives and condominiums with a 3 -month absorption rate of 44 . Cooperatives and condominiums are predominately 2 bedrooms or larger and 54 percent of them are located in the South region of the United States (see table 6).

Furnished rental units accounted for 3 percent ( $\pm 0.4$ percentage points) of the total number of privately financed apartments. Three months after completion of these units, 90 percent were absorbed. While about one-half of all unfurnished units are the-2-bedroom type, only one out of seven of the furnished are 2 -bedroom units. The survey indicates that a furnished apartment is likely to be smaller than an unfurnished one, with the one and no bedroom categories accounting for 85 percent of the furnished units while these categories are 45 percent of the unfurnished (see tables 4 and 5).

Excluded from the survey are units in federally subsidized properties, 10 percent ( $\pm 0.8$ percentage points), built under these programs of the Department of Housing and Urban Development: Senior Citizens Housing direct loans (Section 202), FHA below-market interest rate mortgages (Section 221 BMIR), FHA interest supplements on rental mortgages (Section 236) and all units in buildings containing apartments in the FHA rent supplement program. However, the data include privately owned housing, subsized by State and local governments. In addition, 4 percent ( $\pm 0.6$ percentage points) are excluded for other reasons including turnkey housing (privately built and sold to local public housing authorities subsequent to completion).

[^1]
## ILLUSTRATIVE USE OF THE TABLE OF STANDARD ERRORS

Table 1 of this report shows that 33,743 units completed in 1975 rented for $\$ 150-\$ 174$. Table A shows the standard error of an estimate of this size to be approximately 2,253 . The chances are 68 out of 100 the estimate differs from a complete census by less than 2,253 . The chances are 95 out of 100 that the estimate differs from a complete census by less than 4,506 (twice the standard error).

Table 1 shows the rate of absorption after three months for these 33,743 units is 77 percent. Table B shows the standard error of a 77 percent rate on a base of 33,743 to be approximately 3.4 percent. Consequently, chances are 68 out of 100 that the estimated rate would be within 3.4 percentage points of a complete census figure and chances are 95 out of 100 that the estimated rate would be within 6.8 percentage points of a census figure; i.e., the 95 percent confidence interval would be from 70.2 to 83.8 percent.
