

Figure 1. Total Population and Population Missing Due to HIV/AIDS Epidemics: 2012 Selected Countries in Sub-Saharan Africa

The HIV/AIDS pandemic has impacted the populations of many African countries. Ten countries in Africa with recent population projections were selected for Figures 1 and 2. These countries have suffered the combined loss of more than 14.5 million people. The scales of the epidemics vary, with some countries more heavily impacted than others. The population missing due to HIV/AIDS represents nearly 12 percent of Zambia's current population.

NOTE: The graph compares a 2012 population estimate for a country to a "Without-AIDS" scenario that reflects a hypothetical population that would have resulted if the country had never been affected by an AIDS epidemic. The "missing population" is the difference between these two estimates. The 2012 country population estimates and the hypothetical "Without-AIDS" scenarios are the results of modeling produced by the U.S. Census Bureau.
