

Manufacturing and International Trade Report

Values in the Manufacturing and International Trade Report (MITR) are based on manufacturing data from the 2022 Econ Census (EC), 2021 Annual Survey of Manufactures (ASM), and administrative records from official U.S. import and export merchandise trade statistics. Data users who create their own estimates using data from this report should cite the Census Bureau as the source of the original data only.

Data Comparability

Import and export data are classified using 10-digit commodity codes based on the Harmonized System. For this release, a concordance maps import and export commodity codes to 10-digit North American Product Classification System (NAPCS) based Collection Codes that are used in the EC and ASM. Where a commodity code could potentially be mapped to more than one 10-digit NAPCS-based Collection Code, a forced concordance is used to map the commodity code to one NAPCS-based Collection Code, based primarily on the manufacturing value of shipments and agreed upon by subject matter experts. Due to this forced concordance, some NAPCS codes associated with published EC and ASM product values may not have a direct concordance link to specific import and export codes. Where this happens, an N symbol is used to show trade and/or manufacturing data are not available, or the codes are not linked in the concordance. Note that differences exist between the 2021 ASM and 2022 EC NAPCS as the ASM is associated with 2017 NAPCS and the EC with 2022 NAPCS vintages.

For a given NAPCS-based Collection Code, the Value of Product Shipments may be lower than the Domestic Export Value of Goods and may occur for several possible reasons. First, the Domestic Export Value of Goods is not limited to manufacturers and may include exports from individuals and other business establishments, such as retailers and wholesalers. Second, there may be a lag between when a given product was manufactured and when it was exported, which may occur when a finished good is exported from an establishment's inventories. Third, the Domestic Export Value of Goods is the value at the U.S. seaport, airport, or border port of export, based on the transaction price, which includes inland freight, insurance, and other charges incurred in placing the merchandise alongside the carrier at the U.S. port of exportation. Fourth, if a foreign good was imported and improved in value, the finished good would be considered domestic when exported, and its value would represent the transaction value (not just the domestic value added).

Confidentiality

The Census Bureau has suppressed some data in this release to protect confidentiality. Title 13 United States Code, Section 9, prohibits the Census Bureau from publishing results in which an individual's or business' data can be identified. For more information on how the Census Bureau protects the confidentiality of data, see the disclosure limitation topics listed below as appropriate.

Disclosure Avoidance

Disclosure is the release of data that reveals information or permits deduction of information about a particular survey unit through the release of either tables or microdata. Disclosure avoidance is the process used to protect each survey unit's identity and data from disclosure. Using disclosure avoidance procedures, the Census Bureau modifies or removes the characteristics that put information at risk of disclosure. Although it may appear that a table shows information about a specific survey unit, the Census Bureau has taken steps to disguise or suppress a unit's data that may be "at risk" of disclosure while making sure the results are still useful.

Cell suppression is a disclosure avoidance technique that protects the confidentiality of individual survey units by withholding cell values from release and replacing the cell value with a symbol, usually a "D". If the suppressed cell value were known, it would allow one to estimate an individual survey unit's response too closely. The cells that must be protected are called primary suppressions.

To make sure the cell values of the primary suppressions cannot be closely estimated by using other published cell values, additional cells may also be suppressed. These additional suppressed cells are called complementary suppressions.

The process of suppression does not usually change the higher-level totals. Values for cells that are not suppressed remain unchanged. Before the Census Bureau releases data, computer programs and analysts ensure primary and complementary suppressions have been correctly applied.

In accordance with federal law governing census reports (Title 13 of the United States Code), no data are published that would disclose the operations of an individual establishment or company. Additional information on the techniques employed to limit disclosure in the Census Bureau's economic surveys are discussed at:

<https://www.census.gov/programs-surveys/economic-census/technical-documentation/methodology.html>

Disclosure analysis is performed at the field level, i.e., disclosure analysis performed for each variable independent of other variables. When data are suppressed, these data still are included in higher-level totals.

The Census Bureau has reviewed the data product to ensure appropriate access, use, and disclosure avoidance protection of the confidential source data. (Project No. P-7500114, Disclosure Review Board (DRB) approval number: CBDRB-FY2-086 and Project No. 7504609, Disclosure Review Board (DRB) approval number: CBDRB-FY23-099). Background on cell suppression, cell sensitivity and the protection of statistical data can be obtained from the Federal Committee on Statistical Methodology's Working Paper 22 (Harris-Kojetin et al, 2005).

Reliability of the Data

The sample estimates presented in this report that are produced from the EC or ASM are subject to sampling error. Sampling error is the difference between estimates obtained from a sample and results theoretically obtainable from a comparable complete enumeration of the sampling frame. The particular sample used in this survey is one of a large number of samples of the same size that could have been selected using the same sample design. Because each unit in the sampling frame had a known probability of being selected into the sample, it was possible to estimate the sampling variability of the survey estimates. For an estimate produced from the EC or ASM and displayed in this report, its relative standard error is displayed with the estimate and is defined as the standard error of the estimate divided by the estimate. In conjunction with its associated estimate, the relative standard error may be used to define confidence intervals (ranges that would include the comparable, complete-coverage value for specified percentages of all the possible samples). To illustrate, if all possible samples were surveyed under essentially the same conditions, and an estimate and its standard error were calculated from each sample, then approximately 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average estimate derived from all possible samples and approximately 90 percent of the intervals from 1.645 standard errors below the estimate to 1.645 standard errors above the estimate would include the average estimate derived from all possible samples. In the example above, the margin of error (MOE) associated with the 90 percent confidence interval is the product of 1.645 and the estimated standard error.

The data presented in this report are also subject to nonsampling error, which encompasses all factors other than sampling error that contribute to the total error associated with an estimate. Nonsampling error can be attributed to many sources that include the inability to identify all cases in the population; definition and classification difficulties; differences in respondents' interpretation of questions; errors in recording or coding the data collected; and other errors of collection, response, coverage, processing, and estimation for missing or misreported data. These errors may occur for a sample survey or a census. Most of the important operational errors were detected and corrected during the course of reviewing data for reasonableness and consistency. Though nonsampling error is not measured directly, quality control procedures are employed throughout the survey process to minimize this type of error. The Census Bureau recommends that individuals using these estimates factor in this information when assessing their analyses of these data, as nonsampling error could affect the conclusions drawn from the estimates.

For more information about the 2022 EC methodology see:

<https://www.census.gov/programs-surveys/economic-census/year/2022/technical-documentation/methodology.html>

And the 2021 ASM see:

<https://www.census.gov/programs-surveys/asm/technical-documentation/methodology.html>

Definitions of Terms

NAPCS

The North American Product Classification System (NAPCS) is a comprehensive, market- or demand-based, hierarchical classification system for products (goods and services) that (a) is not industry-of-origin based but can be linked to the NAICS industry structure, (b) is consistent across the three North American countries, and (c) promotes improvements in the identification and classification of service products across international classification systems, such as the Central Product Classification System of the United Nations.

Additional information on NAPCS is available at:

<https://www.census.gov/naics/napcs/>

NAPCS-based Collection Codes

NAPCS-based Collection Codes were introduced in the 2017 Economic Census, and they subsequently replaced the Numerical List products in the 2018 and subsequent Annual Survey of Manufactures. NAPCS-based Collection Codes are 10 digits long. NAPCS-based Collection Codes ending in "0" are higher-level 'broad line' codes in the two-level NAPCS-based Collection Code hierarchy of broad lines and detail lines. The Manufacturing and International Trade Report (MITR) only publishes data for NAPCS-based Collection Codes at the broad line level, the level collected and published in the Annual Survey of Manufactures. NAPCS-based Collection Codes for the 2022 EC are consistent with 2022 NAPCS-based Collection Codes and NAPCS-based Collection Codes for the 2021 ASM are consistent with 2017 NAPCS-based Collection Codes.

Special NAPCS-based Collection Code

NAPCS-based Collection Code 201212AAAA is a special pseudo code created for the MITR to present export data for civilian aircraft, engines, equipment, and parts on a NAPCS basis. These data, though collected on a more granular basis, are published at a higher level due to data disclosure restrictions.

Value of Product Shipments

Value of Product Shipments includes the total value of all products produced and shipped by all producers. For selected products, this can represent value of receipts, value of production, or value of work done. Products that are published on these unique bases are separately identified in the product line description.

The manufacturing product data from the 2021 Annual Survey of Manufactures that are included in the MITR can be found at:

[2021 ASM Tabulations](#)

And the 2022 Economic Census data at:

[2022 EC Tabulations](#)

Export Values

Export values of goods are provided for both Domestic Exports and Total Exports. Total Exports is defined as the sum of Domestic and Foreign Exports. Definitions of these export values are available in the Guide to Foreign Trade Statistics, which can be found at:

<http://www.census.gov/foreign-trade/guide/sec2.html#coverage>

Import Values

Import values of goods are provided for both General Imports and Consumption Imports. Definitions of these import values are available in the Guide to Foreign Trade Statistics, which can be found at:

<http://www.census.gov/foreign-trade/guide/sec2.html#coverage>

Harmonized System

The Harmonized System (HS) is an international classification system administered by the World Customs Organization. The 2-, 4-, and 6-digit HS headings and subheadings are the basis for the 10-digit statistical classification systems used in the United States. The HS is revised approximately every five years. For more information, see

<http://www.wcoomd.org>

In the United States, the import classification system is called the "Harmonized Tariff Schedule of the United States Annotated (HTSA)" while the export system is called the "Schedule B".

Note: If the hyperlinks do not direct you to the source tables, copy and paste addresses directly into your web browser.

Symbols

D: Withheld to avoid disclosing data for individual companies; data are included in higher level totals where appropriate.

N: Trade and/or manufacturing data are not available, or the codes are not linked in the concordance.

S: Withheld because estimate did not meet publication standards.

A: Relative standard error is 100 percent or more.

X: Not Applicable

s: Relative standard error is more than 40 percent and less than 100 percent.

Manufacturing and International Trade Report: 2022 and 2021

In thousands of dollars. Values are based on manufacturing data from the 2022 EC, 2021 ASM, and administrative records from official U.S. import and export merchandise trade statistics.

D: Withheld to avoid disclosing data for individual companies; data are included in higher level totals where appropriate.

N: Trade and/or manufacturing data are not available or the codes are not linked in the concordance.

S: Withheld because estimate did not meet publication standards.

A: Relative standard error is 100 percent or more.

X: Not Applicable

s: Relative standard error is more than 40 percent and less than 100 percent (displayed as a superscript).

Details may not sum to totals due to rounding.
