Comparability of figures for classes of banks is affected somewhat by changes in Federal Reserve System membership, deposit insurance status, and reserve classifications of cities and individual banks, and by mergers, etc.
${ }^{2}$ Member commercial banks exclude, and mutual savings banks include, mutual avings banks which are members of the Federal Reserve System as follows: 3 from 1941 through 1959, 2 in 1960, and 1 in 1961-1970.
${ }^{2}$ In 1969 and 1970, loans and securities are stated on a gross basis ${ }^{4}$ Figures for member commercial banks exclude, and figures for noninsured nonmember commercial banks include 1 member nondeposit trust company which is not insured by the Federal Deposit Insurance Corporation.

[^221]Series X 634-655. National Banks-Number of Banks and Principal Assest and Liabilities: 1863 to 1970-Con.

* Denotes first year for which figures include Alaska and Hawaii.
of Beginning in 1948, figures for loan items are shown gross (i.e. before deduction of valuation reserves); they do not add to the total in 1948-1968 and are not entirely comparable with prior figures. Total loans were shown as net prior to 1969.
${ }^{3}$ Before 1903 , includes securities borrowed. Reserve bank stock, of national banks; reported with "other assets."
${ }^{4}$ In 1969 and 1970 , loans and securities are stated on a gross basis in "total assets" of commercial banks. Total reserves on loans and securities of commercial banks are included in "other liabilities."
${ }^{5}$ Excludes one national bank in Alaska.
- Comparable with later data.
${ }^{7}$ Beginning 1966, includes domestic interbank deposits only; for 1961-1965, includes domestic interbank and postal savings deposits. Prior to 1966, includes deposits of foreign banks.
${ }_{9}^{8}$ Comparable with earlier data.
© U.S. Government securities only.
10 Includes State banknotes outstanding.

Series X 656-677. Nonnational Banks-Number of Banks and Principal Assets and Liabilities: 1863 to 1970
[In milions of dollars, except number of banke. As of June 30 or nearest available date]

See footnotes at end of table.

Series X 656-677. Nonnational Banks-Number of Banks and Principal Assets and Liabilities: 1863 to 1970-Con.

${ }^{1}$ Beginning in May 1942, 60 new reporting centers (affecting series X 706 and X 709 ) and a number of banks in previously included reporting centers (affecting all series) were added to those centers and banks included for the years prior to 1942. The figures for the period 1942-1952 are therefore not strictly comparable with those for the earlier years. The extent of the change in coverage is reflected for 1942 by comparing the

607,071 ; series X $707-210,961$; series X 708-342,430; series X 709-53,679. (See Federal Reserve Bulletin, Aug. 1943, p. 717.)
${ }^{2}$ The number of centers in this group varied considerably; see text.
${ }_{4}^{3}$ Excludes interbank deposits and collection items.
${ }_{5}$ Partly estimated for first 4 months.
511 months only; data for Mar. 1933 not available because of bank holiday.

* Denotes first year for which figures include Alaska and Hawaii.
${ }^{1}$ For 1925, 1926, and 1932-1970, figures are as of December; for earlier years they are as of different dates for banks and branches: For banks, 1927-1931 and 1923-1924, as of December; for 1915-1922, as of June; for branches, 1924 and 1927-1931, as of June; prior to 1924, not for any uniform month. Figures in this table prior to 1947 have not been revised to bring them into conformity with the revised all-bank data eferred to in the general note for series $X$ 561-820.
Fedeal Reserve man changes in federal Reserve membership, deposit insurance status, and reserve classifications of
${ }^{3}$ Federal deposit insurance is compulsory for member banks of the Federal Reserve System.

None in Alaska and Hawaii.
${ }^{5}$ Member commercial banks exclude, and mutual savings banks include, mutual savings banks which are members of the Federal Reserve System as follows: 3, 19411959, 2 in 1960, and 1 in 1961-1970.
${ }_{7}$ In 194', the series was revised. See footnote 6 to series X $731-740$. and the number of nonmember banking offices by insurance status is not available prior to 1935 .

[^224] secured from insured banks.

Series X 731-740. Branch Banking: 1900 to 1970

Series X 731-740. Branch Banking: 1900 to 1970-Con.

[^225]${ }^{5}$ Banking facilities are provided at military and other Government establishments through arrangements made by the Treasury Department with banks. Some of these facilities are operated by banks that have no other type of branch or additional office. ${ }^{6}$ State member bank figures include 1 noninsured trust company without deposits. areas) to the number of banks in the uniform all-bank series inaugurated in 1947 by the Federal bank supervisory authorities. The revision resulted in a net addition of 115
banks and 9 branches. operating branches, except for mutual savings banks for 1935 which are deposits. For other years data are not available. Prior to 1949 commercial bank figures exclude a small amount of deposits of private banks, data for which are a vailable for selected years only
as follo ws: $1935, \$ 46$ million; $1939, \$ 102$ million; and $1941, \$ 138$ million.

Series X 741-755. Bank Suspensions-Number and Deposits of Suspended Banks: 1864 to 1970

[^226]Series X 756-767. Banks Closed Because of Financial Difficulties: 1934 to 1970

[^227]${ }^{4}$ Previously published data adjusted to add 4 cases in 1934; 1 in 1937; 1 in 1938; 2 in 1939; 1 in 1940; 1 in 1941; and to exclude 1 case in 1935; and 1 case in 1938. Deposits not available for 1 bank in 1938; 2 in 1939; 1 in 1940; 1 in 1941; and 1 in 1954.
Excludes 1 bank placed in receivership in 1934, with no deposits at time of closing. Deposits are not available for 7 banks.

5 includes loss in the 1938 case mentioned in footnote 2 and estimated loss in cases not yet closed. Beginning 1962, data are changes in amount of the cumulative losses during the year. Figure in parentheses represents net recoveries. Total losses (including estimated losses in active coses) at end of 1970 were $\$ 67703$.
${ }_{6}$ Tabulated by Federal Deposit Insurance Corporation from receivership records. Includes loss in the 1938 case mentioned in footnote 2 and estimated loss in cases not yet closed.
Government, requiring disbursements by FDIC

Series X 768-775. National Banks-Earnings and Expenses: 1869 to 1970
[In millions of dollars, except number of banks. Includes Alaska, Hawaii, and outlying areas]

${ }^{1}$ All data except number of banks are for calendar year, 1919-1970; year ending June 30, 1907-1918; and year ending Aug. 31, 1869-1906. Number of banks are as of end of
period.
2I Income taxes have been treated as an expense throughout. Beginning in 1943, these
figures differ from those shown in the source volume, because income taxes in the source figures differ from those shown in the source volume, because income taxes in the source volume are shown separately from other expenses and as a deduction from net current earnings.

Series X 776-791. Insured Commercial Banks-Earnings and Expenses: 1934 to 1970
[In millions of dollars, except number of banks. Includes Alaska, Hawaii, and outlying areas]

# Nonbank Financial Institutions (Series X 821-878) 

## X 821-878. General note.

Financial institutions other than commercial banks perform a role in credit and capital markets by mobilizing the savings of individuals and channeling these funds among various types of investments. As a result, the flow of savings to these institutions and the allocation of these funds to various investments are important determinants of interest rates and prices of securities.

X 821-833. Assets and liabilities of mutual savings banks, 1896-1970.
Source: Board of Governors of the Federal Reserve System. 1896-1944, All-Bank Statistics, 1959, table A-4; 1945-1962, Supplement to Banking \& Monetary Statistics, section 12, "Money Rates and Securities Markers," table 26; 1963-1970, Federal Reserve Bulletin, March 1973, p. A39.

Mutual savings banks are mutual thrift institutions chartered by individual States, primarily those in the northeastern part of the United States. They have no capital stock or stockholders. Incorporators provide initial guaranty and expense funds, and under stated conditions these funds may be returned to them out of subsequent earnings. Most deposits in mutual savings banks take the form of passbook savings. After expenses of operations are paid, all earnings are either distributed as interest to depositors or added to reserves (surplus).

Data for 1930 and earlier years are from the Board of Governors of the Federal Reserve System. For 1931-1945, figures were obtained by the National Association of Mutual Savings Banks from State banking departments and directly from some individual savings banks. Reporting procedures for State banking departments were not completely uniform in this period and differed in some respects from those prescribed by the Federal Deposit Insurance Corporation. Beginning 1946, the data were collected by the National Association directly from individual savings banks and generally conform to FDIC reporting procedures.

X 834-844. Selected assets and habilities of savings and loan associations, 1900-1970.

Source: U.S. Savings and Loan League, Savings and Loan Fact Book, 1967, p. 70; 1971, p. 79; and 1972, pp. 95 and 97.

Savings and loan associations-also known as cooperative banks, building and loan associations, and savings associations-are thrift associations chartered by individual States or by the U.S. Government.

Figures were compiled from the following sources: 1900-1933, U.S. Savings and Loan League, Chicago, III.; for insured associations, 1934-1949, annual supervisory reports; 1950-1970, monthly supervisory reports; and for uninsured associations, 1932-1970, annual supervisory reports. Resources of associations in liquidation are not included.

## X 845-849. Postal Savings System, 1911-1967.

Source: U.S. Post Office Department, Annual Report of the Postmaster General, 1957 and 1969, and unpublished data.

The Postal Savings System was discontinued April 27, 1966, and the accounts were eliminated after June 30, 1967.

#### Abstract

X 850-863. Outstanding loans and loan insurance or guarantees of Federal and federally sponsored agencies, by economic sector served, 1917-1953.

Source: R. J. Saulnier, Harold G. Halcrow, and Neil H. Jacoby, Federal Lending and Loan Insurance, Princeton University Press, 1958, appendix A, pp. 365-380 (copyright).

These series are combinations of data shown separately in the source volume for Federal and federally sponsored agencies. That volume shows amount extended during the year as well as amount outstanding. The economic sectors shown here are the major sectors shown in the source volume and an "other" group which combines minor governmental units and miscellaneous sectors. The coverage and classification are described in the source, chapter 1 , pp. 3-27, the footnote on pp. 28-29, and footnotes of tables Al to A8. The following paragraphs are adapted from that text.

Federally sponsored agencies include all those having a special financial or administrative connection with the Federal Government, whether or not Federal funds were currently invested in them. Thus, they include agencies that were in some respects private or cooperative in ownership and organization but that operated in part with Federal funds; and agencies that, although no longer using Treasury funds, were specially connected with some Federal agency through the latter's power to appoint policymaking officers and in some cases to review policy decisions.

The Federal agencies represented under the various categories of loans, insurance or guarantees, and stock purchases are summarized in the source in footnotes to the economic sector tables (pp. 365-380) and are shown in greater detail in the source tables covering individual agencies (pp. 381-418). For example, among agencies making direct loans to the business sector were the Export-Import Bank of Washington, the Departments of Army and Navy, the Public Works Administration, the War Finance Corporation, the Reconstruction Finance Corporation, and the Smaller War Plants Corporation. Federal Reserve bank loans and participations in loans of private financing institutions to business under section $13 b$ of the Federal Reserve Act were also included. Guarantees of loans to the business sector included guarantees by the Veterans Administration and by Federal agencies under Regulation $V$ of the Board of Governors of the Federal Reserve System, as well as deferred participation commitments of the Reconstruction Finance Corporation.

Credit programs not covered by the tabulation shown here include loans to foreign governments (except the Export-Import Bank), direct and guaranteed loans by the Commodity Credit Corporation, and loans to State governments. Loans of the Export-Import Bank of Washington which could not be fully separated from lending to foreign concerns and to domestic concerns engaged in foreign trade were included in the business sector.

Outstanding amounts relate to three basic categories of Federal credit activities.

X 850-855, direct loans. These include (a) the full amounts of loans extended by specified Federal and federally sponsored agencies; (b) the amounts disbursed to private lenders by Federal agencies in purchasing outstanding loans made under Federal insurance or guarantee; and (c) the amounts disbursed on loans made in participation with private lenders.

Loans exclude credit extended incident to some other activity, as when the U.S. Commercial Company gave open book credit during

World War II in connection with its sales of commodities, and also grant-in-aid programs. Loans made indirectly-as when the Federal intermediate credit banks discount paper for production credit associations, enabling the latter to make loans to farmers-are included, as well as loans going directly to the ultimate borrower; but there is no double counting that would result from interagency loans.
X 856-860, loan insurance or guarantees. Loan insurance covers the full amounts of loans extended by private lenders and insured by Federal agencies. Loan guarantees cover (a) the amounts federally guaranteed, ranging from 100 percent to seldom lower than 50 percent of a privately made loan; and (b) the amounts of the Federal shares authorized under deferred participations, where the Government was ready to take up an agreed percentage of a privately made loan. Thus, credit actually extended under participation agreements with private lenders is included under direct loans; but during the time when there was merely a commitment outstanding to take up all or some part of a loan at the option of the private lender, the amount of the obligation is included as a loan guarantee.

X 861-863, stock purchases. Such purchases are included if identifiable as primarily credit aid, and they covered the amount of Federal funds invested. Stock purchases represent purchases of, and loans on, preferred stocks of banks and insurance companies, and purchases of capital notes and debentures of banks, by the Reconstruction Finance Corporation; purchases of shares of savings and loan associations by the Home Owners' Loan Corporation and the Treasury Department; purchases of stock of agricultural cooperative
associations by the Tennessee Valley Associated Cooperatives, Inc.; and purchases of Class A stock of production credit associations by the production credit corporations.

X 864-878. Federal and State-chartered credit unions-number, members, savings, loans, and total assets, 1925-1970.
Source: U.S. National Credit Union Administration, 1970 Annual Report of the National Credit Union Administration, and the 1970 State-Chartered Credit Union Annual Report.
Early data on operations of credit unions are available in U.S. Bureau of Labor Statistics, Monthly Labor Review, 1936-1953 (usually in the latter part of the year), and in BLS Bulletin Nos. 797, 850, 894, and 922.

Data for Federal credit unions, which were authorized by legislation enacted in 1934, represent all operating unions. Data on Statechartered credit unions have been furnished annually by State officials charged with the supervision of such credit unions, to the National Credit Union Administration (formerly Bureau of Federal Credit Unions) since 1951, and to the Bureau of Labor Statistics prior to 1951. Figures for State credit unions represent reporting unions which, in recent years, have included more than 99 percent of all active unions; prior to 1939, the proportion reporting was about 80 percent.

Loans of credit unions (series X 873-875) are principally shortterm consumer loans, but they include some real estate mortgage loans and a small amount of business loans.

[^231]${ }_{3}^{2}$ Data for 1935-1944, partly estimated.

## Insurance (Series X 879-962)

## X 879-917. General note.

There are three general sources of primary data about life insurance as a whole: The various State insurance departments through their reports of the life insurance companies operating within their jurisdictions; commercial publishers of life insurance company data; and the trade and other associations of the life insurance companies.
Probably the most widely used of the State insurance department reports are those published annually by the New York Insurance Department. For the approximate period 1860-1880 these reports, which give data on the companies domiciled in the State and the companies of other States authorized to transact business in the State, are most frequently made use of to exhibit the progress of life insurance. The data presented in these reports for this period represent a very high percentage of the total life insurance business. Other State reports often consulted by researchers are those of Massachusetts and Connecticut.
Of the commercial publications, the most frequently used to study the progress of life insurance as a whole is the Spectator Insurance Year Book, published annually since 1873 by the Spectator Company, Philadelphia. (For 1873-1937, the publication was known as The Insurance Year Book. There were separate "Life" volumes from 1923-1963 and "Property, casualty" volumes through 1960.)

A number of the trade and other associations in the life insurance business prepare industrywide statistics on different aspects of life insurance. The Institute of Life Insurance, New York, a public relations organization formed by the life insurance companies, compiles a number of such statistics and publishes these, as well as data from other associations and from commercial publishers, annually in the Life Insurance Fact Book. Two major sources of insurance statistics included in the Institute compilations are the American Life Insurance Association and the Life Insurance Agency Management Association.

To obtain a series of figures over a long period it is not necessary to consult each annual edition of the publications mentioned above. Many of the New York Insurance Reports (known also as the Annual Report of the Superintendent of Insurance) contain a chronology which gives some of the salient statistics over a long period (sometimes only for selected years). Prior to 1963, the annual Spectator Insurance Year Book often gave the aggregates for all available companies for the preceding 10 years and, for the early years of this publication, a summary of data was presented for the companies operating in New York State. Thereafter, the monthly Spectator Magazine presents data on life, property, accident, and health companies.
The most recent Life Insurance Fact Book will generally give most of the preceding statistics compiled, as well as historical statistics from other sources, as far back as 1890 for some series.

In addition to the Life Insurance Fact Book, there are two compilations of historical statistics which are often consulted: J. Owens Stalson, Marketing Life Insurance, Its History in America, Harvard University Press, Cambridge, 1942 (the appendixes give data on the number of companies, life insurance sales, life insurance in force, and income as well as many other items from earliest available figures to 1937); and Frederick L. Hofman, "Fifty Years of American Life Insurance Progress," Quarterly Publications of the American Statistical Association, New Series, No. 95, vol. XII, Boston, 1911 (tables of salient statistics, 1860-1910). The statistics presented in these publications do not always agree with the figures given here because in some cases different sources have been used, and in some cases adjustments and corrections of the source material have been made by the Institute of Life Insurance.

Because it represents the exception rather than the rule, it may be of interest to note two instances in which data on life insurance were collected in the decennial census of the United States. Statistics of the United States in 1860, 1866, pp. 293-294, contains some statistics on the number of life insurance companies, the amount of life insurance, the number of persons insured, and the annual premium income for 1860. Data on the life insurance business are also shown in the Report on Insurance Business in the United States at the Eleventh Census: 1890, Part 2, Life Insurance, 1895. This report contains statistics on life insurance for the decade 1880-1890 for the companies in operation as of December 31, 1889. It does not, however, reflect the business in this decade of companies which ceased to do business before December 31, 1889.
The basic reporting form utilized by all three types of primary sources in preparing their statistics is the annual statement convention blank. This is the prescribed accounting statement which each company must submit to the insurance department of each State in which it is licensed to transact business, setting forth the company's balance sheet, income and disbursement accounts, policy exhibit, and many supporting schedules. The collecting agencies supplement the data from the anmual statement form from time to time through mail questionnaires, mostly among the life insurance companies.
An understanding of the historical statistics of life insurance requires some knowledge of the annual statement convention blankthe accounting methods used in preparing the form and changes in the form and methods over the years-and some knowledge of the history of life insurance.

Uniformity in the annual statement convention blank required by the States has been achieved through the efforts of the National Association of Insurance Commissioners. This association is a national organization composed of the officials of the various States who have supervision of insurance affairs within their respective States. It was formed in 1871 (under the name of the National Convention of Insurance Commissioners) and adopted its first convention blank in 1874. This organization has also achieved a degree of uniformity in insurance legislation and departmental rulings among the different States.

The convention blank has undergone revisions from time to time. The most recent significant revision in the annual statement convention blank took place in the form used for reporting the operations for 1951. Where these changes have affected the statistics shown, they are discussed below in the text for the specific series. For a complete discussion of the annual statement form now in use, and a comparison with the superseded form, see E. C. Wightman, Life Insurance Statements and Accounts, Life Office Management Association, New York, 1952 and J. C. Noback, Life Insurance Accounting, Irwin, Homewood, Ill., 1969. For a detailed discussion of two of the earlier forms, see Life Insurance Accounts, 1935 and 1941, by Wightman.

There are many nonstatistical histories of life insurance. A few that may be consulted are: Charles K. Knight, The History of Life Insurance in the United States to 1870, unpublished thesis, University of Pennsylvania, 1920; Marketing Life Insurance, Its History in America (cited above); and The Bible of Life Insurance, George W. Wadsworth, 1932.

The data presented here cover only life insurance as it relates to the insurance companies which are usually referred to as the legal reserve life insurance companies. These are life insurance companies operating under insurance laws specifying the minimum basis for the reserves a company must maintain on its policies. Other types of
life insurance include fraternal life insurance which is provided by societies, lodges, and similar fellowship organizations; life insurance with assessment associations, mutual aid groups, and burial societies; life insurance available through savings banks in three States; and veterans life insurance (consisting of U.S. Government Life Insurance and National Service Life Insurance) issued by the Federal Government to members of the Armed Forces and veterans of World Wars I and II.
Though in very recent years the greatest part of all life insurance in force in the United States has been provided by the legal reserve life insurance companies, veterans insurance at its peaks during or immediately after the World Wars exceeded or nearly equaled the totals achieved by the life insurance companies. Fraternal and assessment life insurance combined for the period 1879-1928 was a significant proportion of the life insurance company total (actually exceeding it for a year or two in the 1890's and never amounting to less than 10 percent of the life insurance company total for the period stated).
For historical statistics of veterans, fraternal, and assessment life insurance, see Stalson, Marketing Life Insurance, cited above, pp. 806-808 and 816-819.
The data for legal reserve life insurance companies which are presented here are subject to three types of limitations: (a) Changes in the annual statement convention blank on which the companies report their operations; $(b)$ incompleteness of the data in terms of the number of companies for which information is available; and (c) lack of uniformity among the companies in the allocation of certain items to the categories of the convention blank, changes in allocation, and changes made by the publishers of life insurance data in their reporting methods.
Changes in the annual statement blank over the years have been discussed previously. With regard to the completeness of the statistics available, it is extremely difficult to obtain data for any given period on the operations of all the life insurance companies operating in the United States. Theoretically, one should be able to compile complete statistics by consulting the insurance reports of each State and the District of Columbia, but in practice this is not feasible. State insurance reports began in the 1850's, but it was not until 1919 that all States (and the District of Columbia) were issuing reports. (A list of the first reports on insurance companies by State departments of insurance is given in Stalson, Marketing Life Insurance, cited above, pp. 775-776.) Therefore, until 1919, there is no way of obtaining data from State reports for companies which operated in only those States for which reports were not available. Subsequent to 1919, the difficulties in compiling complete statistics arise from the lack of uniformity in the various reports with regard to the selection of items to be presented and the basis of reporting, and from the failure of some States to issue reports on a regular annual basis.
The life insurance companies omitted from the sources utilized are very small in size relative to those for which data are available. Therefore, even when a fairly large number of these very small companies are omitted, they account for a very small percentage of the total business. For example, in 1970, according to the Institute of Life Insurance, the 1,390 companies for which life insurance in force data were available accounted for 99.96 percent of the total which would have been obtained from the 1,792 companies in existence at the end of 1970. This percentage is doubtlessly lower for the earlier years and for some of the other categories, but it is highly probable that even the oldest figures presented here represent 90 percent or more of the total for all companies. This is true both with regard to the figures taken from sources, such as the Spectator Insurance Year Book, which collect data from all available companies, and for the figures for about 1860-1880 which are taken from the reports of the New York Insurance Department. (For a discussion of the percentage of total business accounted for by the New York Insurance Department reports, see Hoffman, "Fifty Years of American Life Insurance Progress," cited above, pp. 11-13.)

The third limitation with regard to the data of legal reserve life
insurance companies pertains to the lack of uniformity in allocation of certain items to the categories of the convention blank and changes in allocation. There are many instances where neither the categories of the annual statement convention blank nor the instructions for filing the blank are detailed enough to specify clearly how a certain transaction is to be allocated, so that the treatment becomes a matter of the company's judgment. Thus, for example, of two companies writing monthly debit insurance (a form of life insurance with some of the features of both ordinary and industrial insurance), one may classify it as ordinary and one as industrial. Moreover, a company may decide to change the classification of an item; for the example just cited, a company may transfer at some point its monthly debit business from the industrial to the ordinary classification. Such problems can arise in all the series presented. Even when an accounting procedure tends to become widespread, it is often adopted by different companies at different times.

A further problem arises from the fact that the sources which compile industrywide statistics must often combine the many categories of the annual statement convention blank into broader classifications. From time to time, the manner of combining the categories may be altered or the manner of treating special categories, which are sometimes found in a few companies' convention blank, may be changed.

Related to the problems of changes in the annual statement convention blank and variations in the allocation of items is the problem of changes in method of valuation of policy reserves and assets. The amount of policy reserves reported in a company's convention blank is determined by the types of policies issued, the length of time they have been in force, and the age at issue. The policy reserves are also affected by the mortality table used, the interest assumption, and the reserve basis specified by the various States as the minimum basis for valuation. The assets of a company, and hence its surplus, are also affected by the method of valuation of assets. The problems of changes in valuation of assets and reserves do not appear to be factors of major significance, however, with regard to long-term historical trends of these series.

The general procedure used in preparing these statistics was to examine the various sources and compare the series available as to bases of reporting, completeness of coverage, etc. In those cases where alternative series were available, the selection was determined by completeness of coverage in terms of the number of companies for which data were obtainable, and the basis of reporting most consistent with current practice, on two conditions: (a) That the series be available for a sufficiently long period to preserve the trend, and (b) that component items could be obtained on the same basis or level of coverage as the totals. An illustration might make this clear. For 1879-1887, total assets can be obtained for all the companies operating in New York State. For the same period, totals for a larger group of companies can be obtained from the 1888 Spectator Insurance Year Book. The distribution of assets, by type, however, is available only for the companies operating in New York State. Rather than estimate a distribution for the larger asset totals or report a distribution which would not add to the total shown, the New York State figures were used for the total and for the distribution by type. For the period under discussion, the assets of companies operating in New York State represented from 92 to 97 percent of the assets given by the Spectator Insurance Year Book for all available companies.

In most cases, the various sources were identical with regard to bases of reporting and completeness of coverage. In these cases, the procedure was to compare the various sources presenting the same data for the same period. Thus for the early period, comparisons were made among the individual New York Insurance Reports and the summaries of these reports given in various issues of the Spectator Insurance Year Book, Marketing Life Insurance, and "Fifty Years of American Life Insurance Progress." For later years, comparisons were made among the various issues of the Spectator Insurance Year Book which covered the same period (mainly the 10-year aggregates
as compared with the aggregates given in each Year Book), Marketing Life Insurance, and the Life Insurance Fact Book (which utilizes a great deal of material from the Spectator Insurance Year Book).

Where the figures in the various sources were in agreement, the data presented were accepted unless some limitations were uncovered while making the comparisons. Where the sources were not in agreement, the reasons for the differences were investigated and the figures considered to be most accurate and complete were accepted.

Some of the figures presented here are original in the sense that they represent adjustments by the Institute of Life Insurance of existing figures for errors in addition, for omissions, or for changes in definition. Wherever possible, published material has been utilized.

## X 879. Number of life insurance companies, 1759-1970.

Source: J. Owen Stalson, 1759-1936, Marketing Life Insurance, Its History in America, Harvard University Press, Cambridge, 1942, pp. 748-753. Institute of Life Insurance, 1937-1939, estimates; 1940-1970, Life Insurance Fact Book, 1974, p. 87, and unpublished data.

The figures comprise the total number of companies in operation at the end of the year and domiciled in the United States. This number is larger than the number of companies for which life insurance in force data are available (see general note for series X 879-917). For 1941-1949, figures do not include companies which started and then ceased operations within this period. For data on the number of companies formed, discontinued, and in operation, classified by stock and mutual for 1759-1937, see Stalson, cited above, pp. 748-753.

## X 880-889. General note.

For 1854-1894, the series were derived by deducting from the insurance in force figures of U.S. life insurance companies the amount of their Canadian and other foreign business, and adding thereto the U.S. business of Canadian and other foreign companies. Data for 1895-1948 were derived from the totals of individual State estimates given in the "Life Insurance in Force by States" section of each Spectator Insurance Year Book.

For ordinary life insurance, the figures for 1815-1850 are for all available companies; for 1854-1877, the figures are for life insurance companies reporting to the New York Insurance Department. Beginning with 1878 , the data are for all available companies. All the data for group, industrial, and credit life insurance are for all available companies.

Life insurance in force is the sum total of the face amounts (plus additions purchased with dividends) of the life insurance outstanding at a given time. The additional amount of life insurance payable under accidental death provisions (providing for payment of an additional death benefit in case of death as a result of accidental means, often called double indemnity) is not included.

Life insurance in force figures have been adjusted to represent insurance in force on the lives of residents of the United States whether issued by U.S. or foreign companies. For statistics of life insurance in force with U.S. life insurance companies, whether the policyholders are residents of the United States or of some other country, and for the number of policies outstanding, for 1900-1970, see Life Insurance Fact Book, 1974, pp. 25, 27, 30, 33, 35. Estimates by States are available from the "Life Insurance in Force by States" section of the annual Spectator Insurance Year Book and the Life Insurance Fact Book. For information on life insurance in force by plan of insurance, 1950, 1954, 1957, 1962, 1966, and 1970, see The Tally of Life Insuranee Statistics, January 1959, pp. 1 and 2, March 1968, pp. 1 and 2, and November 1971, pp. 1 and 2.

For an alternative series of life insurance in force in the United States, for selected years, 1815-1937, see Marketing Life Insurance, cited above, pp. 816-817. The alternative series includes fraternal, assessment, and other types of life insurance, and is derived from aggregate figures of U.S., Canadian, and foreign companies, rather than as totals of State figures.

X 880. Number of life insurance policies in force in the United States, 1895-1970.
Source: Institute of Life Insurance, Life Insurance Faet Book, various issues.

Data represent all life insurance in force with U.S. life companies, including both direct business and reinsurance acquired. Data include group certificates and credit life insurance.

## X 881. Coverage per family of life insurance in force in the United

 States, 1930-1970.Source: See source for series X 880 .
Families include the units defined by the Bureau of the Census as families, subfamilies, and unrelated individuals.

## X 882. Total life insurance in force in the United States, 1815-1970.

Source: 1815-1850, see Stalson, cited above for series X 879, p. 787 (1850 estimate corrected for addition error); 1854-1899, a summation of series X 883 and X 885. 1900-1970, Institute of Life Insurance, Life Insurance Fact Book, 1974, p. 23, and unpublished data.

X 883. Ordinary life insurance in force in the United States, 18151970.

Source: 1815-1850, see Stalson, cited above for series X 879, p. 787. Institute of Life Insurance, 1854-1894, unpublished data; 18951970, Life Insurance Fact Book, 1958, p. 25, and 1974, p. 23.
The 1854-1894 figures were compiled from the following sources, using the method described in the general note for series X 880-889: Ordinary insurance in force of U.S. companies: 1854-1858, Spectator Company, Spectator Insurance Year Book, 1878, p. 71; 1859-1877, Stalson, cited above for series X 879, p. 820; 1878-1894, Spectator Insurance Year Book, various issues (for certain years, adjustments were made). Ordinary business of U.S. companies in Canada: 18691894, Stalson, cited above for series X 879, pp. 833-834 (1873 figure adjusted; 1885-1894, industrial business in Canada of U.S. companies subtracted to get ordinary business in Canada). Ordinary business of U.S. companies in foreign countries other than Canada: 1868-1885, Stalson, cited above for series X 879, p. 824; 1886-1888, Hoffman, "Fifty Years of American Life Insurance Progress," cited above in general note for series X 879-962, p. 86; 1889-1894, Spectator Insurance Year Book, 1899, p. 466. Ordinary business of Canadian companies in the U.S.: 1889-1894, Stalson, cited above for series X 879, p. 839. Ordinary business of other foreign companies in the U.S.: 1854-1870, series for U.S. branches of British companies estimated by the Institute of Life Insurance; 1871-1881, 1885-1886, State of New York Insurance Department, New York Insurance Report, various issues; 1882-1884, data not available, but probably insignificant.
Ordinary life insurance refers to life insurance usually issued in amounts of $\$ 1,000$ or more, with premiums payable on an annual, semiannual, quarteriy, or monthly basis.

## X 884. Group life insurance in force in the United States, 1911-1970.

Source: Institute of Life Insurance, Life Insurance Fact Book, 1958 , p. 27, and 1974, p. 23.
Group life insurance is life insurance issued, usually without medical examination, on a group of persons under a master policy. It is usually issued to an employer for the benefit of employees. The individual members of the group hold certificates as evidence of their insurance.

## X 885. Industrial life insurance in force in the United States, 18761970.

Source: 1876-1894, Institute of Life Insurance, unpublished data; 1895-1970, see source for series X 884, 1958, p. 31 and 1974, p. 23.

The 1876-1894 figures were compiled from the following sources, using the method described in the general note for series X 880-889: Industrial insurance in force of U.S. companies: 1876-1894, Spectator Company, Spectator Insurance Year Book, various issues (for certain years, adjustments were made). Industrial business of U.S. companies in Canada: 1885-1894, Spectator Insurance Year Book, various issues. Canadian and other foreign companies have never written industrial life insurance in the United States, according to available information.
Industrial life insurance is life insurance issued in small amounts, usually not over $\$ 500$. Premiums are payable on a weekly or monthly basis and are generally collected at the home by an agent of the company.
$X$ 886. Credit life insurance in force in the United States, 1917-1970.
Source: See source for series X 884, 1958, p. 33 and 1974, p. 23.
Credit life insurance is term life insurance sold through a lender or lending agency to cover payment of a loan, installment purchase, or other obligation, in case of death. Lending agencies are defined to include agencies that sell merchandise on time and mortgage departments of life insurance companies, as well as banks, finance companies, and other institutions or agencies to or through which financial obligations are incurred. The data refer to insurance on loans of 10 years or less duration.

X 887-889. Average size policy in force in the United States, 18951970.

Source: Institute of Life Insurance, Life Insurance Fact Book, various issues, and unpublished data.

## X 890-893. General note.

Figures represent U.S. life insurance companies' sales (including reinsurance acquired) in the United States and in other countries. Credit life insurance is excluded.
Life insurance sales represent the sum total of the face amount of life insurance sold in a given period (in this case, one year). The additional amount of life insurance payable under accidental death provisions is not included. For definitions of ordinary, group, and industrial, see text for series X 883-885.

X 890. Total sales of life insurance by U.S. life insurance companies, 1854-1970.
Source: 1854-1920, a summation of series X 891-893; 1921-1970, see source for series X 884, 1958, p. 23 and 1974, p. 16.

Total life insurance sales in the United States, representing all sales to residents of the United States, whether issued by U.S. or foreign companies, are available, beginning with 1940, from the source, p. 20. These series give number of policies and amount of insurance, by type.

X 891. Sales of ordinary life insurance by U.S. life insurance companies, 1854-1970.
Source: 1854-1910, Spectator Company, Spectator Insurance Year Book, various issues (for certain years, adjustments were made by the Institute of Life Insurance); 1911-1920, Institute of Life Insurance, unpublished data (based on data from summary table of Spectator Company, Spectator Compendium of Official Life Insurance Reports for each year); 1921-1970, see source for series X 884, 1958, p. 23 and 1974, p. 16.

The estimates for 1854-1877 are for life insurance companies reporting to the New York Insurance Department. Thereafter, the data are for all available companies. Beginning 1888, the data are on a paid-for basis; beginning 1893, they exclude revivals, increases, and dividend additions.

Monthly sales and annual sales by States since 1923 are available in Life Insurance Agency Management Association, Monthly Sales

Survey, various issues. See also Life Insurance Fact Book, 1947-1972 editions. For regional data, from 1929-1956, see U.S. Office of Business Economics, Business Statistics, 1957 Biennial Edition.

X 892. Sales of group life insurance by U.S. life insurance companies, 1911-1970.
Source: 1911-1920, Institute of Life Insurance, unpublished data (1911-1918, estimated from a survey of companies writing group life insurance at that time; 1919-1920, compiled from Group Life Exhibit in Spectator Company, Spectator Compendium of Official Life Insurance Reports, various issues); 1921-1970, see source for series X 884, 1958, p. 23 and 1972, p. 21.

The group life insurance figures are on a paid-for basis. Figures for 1912-1918 may refiect increases in existing contracts to some extent. Beginning 1919, figures exclude revivals, increases, and dividend additions.

X 893. Sales of industrial life insurance by U.S. life insurance companies, 1873-1970.
Source: 1873-1910, Spectator Company, Spectator Insurance Year Book, various issues; 1911-1920, Spectator Compendium of Official Life Insurance Reports, various issues; 1921-1970, see source for series X 884, 1958, p. 23 and 1972, p. 21.

Beginning 1893, figures exclude revivals, increases, and dividend additions.

## X 894-907. General note.

The data for 1854-1887 are for life insurance companies reporting to the New York Insurance Department. Thereafter, the data are for all available companies.

In general, before 1951, income and disbursement items were reported on a cash basis (in the accounting use of the term). Beginning 1951, income and disbursement items are reported on an accrual basis (reflecting earned income and incurred claims and expenses).

Before 1951, gross investment income (without deduction of investment expenses) was reported as income, and investment expenses were reported as disbursements (included with "Commissions, expenses, taxes, and other disbursements"). Beginning 1951, investment expenses are deducted from gross investment income and the resulting net figure is reported as income.

## $X$ 894-897. Income of U.S. life insurance companies, 1854-1970.

Source: 1854-1910, see first source for series X 893; 1911-1970, see source for series X 884,1958 , p. 53,1970, p. 57 , and 1971, p. 58.

X 895, life insurance premiums. For 1911-1970, this series was obtained by subtracting from premium income as reported in the source, the annuity premium series (series X 896) described below. Since 1947, accident and health premiums have also been subtracted from premium income.

This series includes premiums for ordinary, group, and industrial life insurance, including disability and accidental death provisions. A premium is defined as the payment, or one of the regular periodical payments, a policyholder is required to make for an insurance policy.

X 896, annuity premiums. For 1911-1931, data were obtained by subtracting from the "consideration for annuities" figures given in the aggregates of the Spectator Compendium each year, the amount of supplementary contracts involving life contingencies. The series on supplementary contracts involving life contingencies was compiled by the Institute of Life Insurance from data in the New York Insurance Reports and the annual editions of Alfred M. Best Co., Best's Life Insurance Reports, New York. For 1932-1951, data were obtained directly by summing annuity income items from Spectator Compendium aggregates each year. For 1952-1955, data were obtained by summing group and individual annuity data given in Institute of Life Insurance, The Tally of Life Insurance Statistics,

August 1956, p. 1; for 1956, Institute of Life Insurance, unpublished data; for 1957, Life Insurance Fact Book, 1958, p. 54; for 1958-1964, 1965, p. 57; for 1965-1970, 1971, p. 58.

This category includes considerations for group and individual annuities. Before 1911, figures include considerations for supplementary contracts with life contingencies. An annuity is defined as a contract that provides an income for a specified period of time, such as a number of years or for life. A supplementary contract is an agreement by the company to retain the lump sum payable under an insurance policy and to make payments in accordance with the settlement option chosen.

X 897, investment and other income. For 1911-1970, figures include considerations for supplementary contracts both with and without life contingencies. Before 1911, figures include considerations for supplementary contracts without life contingencies.
X 898-907. Disbursements of U.S. life insurance companies, 18541970.

Source: 1854-1918, Spectator Company, Spectator Insurance Year Book, various issues (for certain years, adjustments were made by the Institute of Life Insurance); 1919-1951, Spectator Compendium of Official Life Insurance Reports for each year; 1952-1970, Institute of Life Insurance, unpublished data.

Annual additions to policy reserves are not included. These constitute the greatest portion of the difference between income and disbursements. For data on policy reserves, see series X 916.

Figures for life insurance benefit payments paid to residents of the United States, either by U.S. or foreign companies, may be obtained, for 1940-1957, from the Life Insurance Fact Book, 1958, p. 39 and for 1958-1970, from the 1971 edition, p. 43. Death benefit payments in the United States by type of insurance, number of policies, and by State may also be obtained from the annual editions of the Life Insurance Fact Book. Monthly benefit figures and quarterly death benefits by States may be obtained from the Tally of Life Insurance Statistics through December 1971; the monthly benefit survey was discontinued thereafter. A summary of monthly data for several years may be obtained from U.S. Bureau of Economic Analysis, Business Statistics, biennial editions.

X 901, matured endowment payments. This series is defined as the proceeds paid under a policy which provides that a definite sum of money be paid to the policyholder after a specified number of years if he is then living. If the policyholder dies during the endowment period, payment is made to a beneficiary (such proceeds are included as death benefits).

X 903, policy dividends. A policy dividend is defined as a refund of part of the premium on a participating life insurance policy. It is a share of the surplus earnings apportioned for distribution and reflects the difference between the premium charged and actual experience.

X 904, surrender values. A surrender value payment is the amount paid to policyholders upon surrender, for cash, of a policy before it becomes payable by death or maturity.

X 905, disability and accidental death benefts. Disability benefits are payments under a feature added to a life insurance policy, providing for waiver of premium and sometimes payment of monthly income if the insured becomes totally and permanently disabled. For definition of accidental death benefits, see general note for series X 880-889.

Disability provisions became general around 1910 and benefits under these were usually included with annuity payments until 1920. Accidental death benefit provisions became general around 1917 and benefits under these were usually included with death benefits until 1920.

X 906, commissions, expenses, taxes, and other disbursements. This series includes payments on supplementary contracts, with and without life contingencies, and payments of dividends which have been left on deposit.

X 907, dividends to stockholders. Dividends to stockholders were shown as a disbursement in the annual statement convention blank before 1951. For 1951-1970, dividends to stockholders have been shown as a deduction from surplus in the surplus account.

## X 908-913. Assets of U.S. life insurance companies, 1854-1970.

Source: 1854-1889, see first source for series X 893; 1890-1970, see source for series X 884, 1958, pp. 64-91 and 1971, p. 68.
The data for 1854-1887 are for life insurance companies reporting to the New York Insurance Department. Thereafter, the data are for all available companies.

Assets are on an admitted asset value basis, which is the aggregate value of ail the assets used for determination of a company's balance sheet in accord with principles adopted by the insurance departments of the various States. Until about 1909, stocks and bonds were reported at market value. Until 1906, this value was determined by each individual company and, since 1907, by the insurance commissioners. In 1909, New York State required amortization of ampiy secured bonds, and this soon became the general practice. Stocks and nonamortizable bonds are generally reported at market value. Assets include the assets, distributed by type, of the accident and health departments of life insurance companies.
Shares of Federal savings and loan associations are included with series X 910. Series X 912 includes real estate sold on contract but does not include real estate owned subject to redemption. Foreclosed liens subject to redemption are included in "mortgages" and not transferred to "real estate" until the redemption period is past.

## $X$ 914. Net rate of interest earned on assets of U.S. life insurance

 companies, 1872-1970.Source: 1872-1909, see first source for series X 893; 1910-1914, Institute of Life Insurance, unpublished data; 1915-1970, see source for series X 884, 1958, p. 59; 1970, p. 64; and 1971, p. 63.

The net rate of interest earned is the ratio of the investment income for the year to the mean assets decreased by one-half the investment income. For 1872-1909, the investment income is gross investment income-i.e., there was no deduction of investment expenses. For 1910-1939, the investment income is net of investment expenses (including direct investment taxes) and the Federal income taxes treated as investment expenses. Beginning 1940, the investment income is net of investment expenses (including direct investment taxes) and all Federal income taxes. For 1872-1950, the assets used in the formula are ledger assets; beginning 1951, the assets are invested assets (including cash) and interest due and accrued.

For a discussion of the level of interest earnings before 1872, see Lester W. Zartman, The Investments of Life Insurance Companies, Henry Holt Company, 1906.

## X 915. Total liabilities of U.S. life insurance companies, 1859-1970.

Source: 1859-1917, see first source for series X 893; 1918-1951, see second source for series X 893; 1952-1970, Institute of Life Insurance, Life Insurance Fact Book, 1953-1958, and 1971 editions.

Data include operations of accident and heaith departments of life insurance companies. The 1918-1981 figures were compiled by subtracting from total liabilities as given, the amount shown as "amounts set apart." The 1932-1942 figures were compiled by subtracting from total liabilities as given, the amounts shown as "special, voluntary contingency, etc., reserves." The 1943-1951 figures are those shown as total liabilities. The 1952-1970 figures were compiled by adding all the reserve and obligation items shown, excluding only special surplus funds, unassigned surplus, and capital.

## X 916. Policy reserves of U.S. life insurance companies, 1860-1970.

Source: 1860-1864, State of New York Insurance Department, New York Insurance Report, 1865, pp. clxxv-clxxix; 1865-1889, see first source for series X 893 (for certain years, adjustments were made
by Institute of Life Insurance); 1890-1970, see source for series X 884, 1958, p. 61, 1970, p. 57, and 1971, p. 65.

This series includes life, annuity, supplementary contract, disability, and accidental death reserves and, beginning 1947, business of accident and health departments of life insurance companies.

Policy reserves are defined as the funds that an insurance company holds specifically for the fulfillment of its policy obligations. Reserves are so calculated that, together with future premiums and interest earnings, they will enable the company to pay all future claims.

X 917. Capital and surplus of U.S. life insurance companies, 18591970.

Source: 1859-1917 (except 1868, 1869, 1870, 1879, and 1881 which are from various New York Insurance Reports), see first source for series X 893; 1918-1951, see second source for series X 893; 19521970, Institute of Life Insurance, Life Insurance Fact Book, 19531958, and 1971 editions.

The 1919-1931 figures were compiled by adding to the "unassigned funds and capital" as given, the amounts shown as "amounts set apart." The 1932-1950 figures were compiled by adding to the "unassigned funds and capital" as given, the amounts shown as "special, voluntary, contingency, etc., reserves" (for 1932-1942, "special, voluntary, contingency, etc., reserves" are shown as "liabilities'; for 1943-1950, this item is shown separately). The 1951-1970 figures were compiled by adding the items "special surplus funds," "unassigned surplus," and "capital."

This series includes operations of accident and health departments of life insurance companies.
X 918-932. Assets, policyholders' surplus, and premiums written of the property-liability insurance business, 1931-1970.
Source: A.M. Best Company, Inc., Morristown, N.J., Best's Aggregates and Averages, 1959, p. 1, and 1971, p. 1. (Copyright.)

The aggregates in these series represent the totals of the propertyliability insurance business except that the mutual company aggregates do not include a very large number of small companies operated on the township or county plans or on the assessment basis. Life insurance companies writing accident and health business are excluded unless they maintained completely segregated departments and statistics so that the separate department figures could be developed.

Aggregates through 1944 are based on the reported statutory underwriting results, with some companies including Federal income taxes as an expense of operation and others excluding them. For 1942 and 1943, the statutory profit before Federal income was estimated at $\$ 115,000,000$ for each year and at about $\$ 70,000,000$ and $\$ 65,000,000$, respectively, after Federal income taxes. For 1944, the corresponding figures were $\$ 100,000,000$ and $\$ 60,000,000$. Beginning 1945, underwriting experience is recorded before Federal income taxes and underwriting results are on a cash basis for reserves.

Prior to 1951, figures included only business written by casualty companies. Figures for all years include Credit, Livestock, and Miscellaneous Unsegregated and Reinsurance Unsegregated Lines.

X 923-927, policyholders' surplus. Represents the sum of paid-in capital, if any, and net reported surplus.

X 928-932, net premiums written. Represents retained premium income, direct or through reinsurance, less payments made for reinsurance ceded.

X 933-946. Underwriting experience for stock and mutual companies, by type of insurance, 1925-1970.

Source: See source for series X 918-932, 1955 issue, pp. 122-125 and 182-185; 1963 issue, pp. 141-144 and 209-212; and 1971 issue, pp. 139-142 and 208-211.

See text for series X 918-932.
X 934, premiums earned. Represents the adjustment of the net premiums written with the increase or decrease during the year in the liability for unearned premiums.
X 935, unearned premiums. Represents the estimated aggregate net amount, after deduction of reinsurance credits, which an insurance company would be obliged to tender to its policyholders as return premiums for the unexpired terms, should it wish to cancel every policy in force.

X 936 and 937, ratios. As to losses, the ratio of losses and claim expenses incurred to premiums earned is used, but expenses incurred are ratioed to premiums written. When premium volume is increasing or decreasing, the combined loss and expense ratio thus calculated is a more accurate gauge of underwriting than the statutory figure.
X 938 and 939, underwriting profit or loss. This item is the statutory figure taken from the annual statements of insurance companies and represents a comparison of losses and expenses incurred with premiums earned, adjusted with minor profit and loss items. This statutory figure does not include any adjustment for the estimated gain or loss in the equity in unearned premium liability.

X 947-956. Stock company resources and operating results, 19101970.

Source: See source for series X 918-932, 1959, pp. 20 and 22, and 1971, pp. 30 and 32.
See text for series X 918-932 and X 933-946.
$\mathbf{X} 954$, investment profit or loss. This item is the statutory figure taken from the annual statements of insurance companies. From 1931 to 1934, arbitrary average values were used in valuing stocks owned by insurance companies; since 1934, market prices have been used for stocks but all bonds not in default have been listed at amortized values. This item, therefore, does not reflect actual market prices for all securities since December 31, 1931, although in most recent years the market prices of high-grade bonds have usually exceeded the amortized values at which they are carried in the statements.

## X 957-962. Subscription or premium income and benefit expenditures

 of private health insurance organizations, 1948-1970.Source: U.S. Social Security Administration, 1948, 1950, 1955, and 1960-1970, Social Security Bulletin, February 1973, tables 17 and 20 ; all other years, unpublished data.
Blue Cross and Blue Shield data were supplied by the Blue Cross Association and the National Association of Blue Shield plans from data reported to them by the individual plans. The data for insurance companies were compiled by the Health Insurance Association of America from its annual survey of the number of persons covered by insurance companies under group and individual policies. The data for independent health insurance plans are estimates of the Office of Research and Statistics, Social Security Administration, based on its annual survey of these plans.

* Denotes first year for which figures include Alaska and Hawaii.
$Z$ Less than 850,000 .
I Beginning 1947, includes data on operations of accident and health departments of U.S. life insurance companies, not shown separately; therefore components will not add to totals.
${ }_{2}$ Beginning 1951 , investment income is net of investment expenses.
3 Beginning 1951, accidental death benefits included with death benefits; figures for
series X 456 are for disability benefits only. Accidental death benefits approximately
$\$ 30$ million in 1951. includes policy dividends paid by accident and health departmentsof U.S. life insurance companies.
${ }^{5}$ Matured endownents included with death annuity premiums included with life insurance premiums
${ }_{7}^{6}$ Annuity premiums included with life indurance premiums.

Series X 908-917. Assets, Earning Rate, Liabilities, and Capital and Surplus of U.S. Life Insurance Companies: 1854 to 1970

## Government

## Elections and Politics (Series Y 1-271)

## Y 1-26. Methods of electing presidential electors, 1788-1836.

Source: Charles O. Paullin, Atlas of the Historical Geography of the United States, Carnegie Institution of Washington and American Geographical Society of New York, 1932, p. 89 (courtesy of the Carnegie Institution).

The presidential electors of each State, now chosen by popular vote in all States, are selected, according to the Constitution, "in such manner as the legislature thereof may direct." The development of political party direction of the electoral college was not anticipated in the Constitution and, during the early years of the Republic, electors were chosen in the several States by a number of different devices. The principal methods were election by the State legislature itself, by State electors popularly chosen to elect presidential electors, and by direct popular vote for the electors. With few exceptions, presidential electors have been elected by popular vote since 1828. The Legislature of South Carolina, however, continued to elect presidential electors until 1860. Since the Civil War, legislatures have chosen electors only twice-in Florida in 1868 and in Colorado in 1876.

## Y 27-78. Voter participation in presidential elections, by State, 1824-1968.

Source: Walter Dean Burnham, Dept. of Political Science, Massachusetts Institute of Technology, unpublished data. The explanatory notes which follow were prepared by Professor Burnham.

The United States, unlike some other countries, has never developed an automatic, governmentally-operated system for enrolling potential voters. The uniform practice since the earliest times has been that each of the States is the sole judge of the electoral procedures which it prescribes within its jurisdiction, subject only to constitutional amendments, congressional legislation enacted pursuant to such amendments or other portions of the Constitution, and Federal judicial decisions. All of these may limit or abolish the States' discretion in specified areas of legal procedure pertaining to elections; otherwise, the general rule stated here has continuously applied to the conduct of elections in the United States. ${ }^{1}$

[^234]As a result of this heterogeneity, it is not possible to achieve precise statements of the eligible electorate. The data in series Y $27-78$ are estimates, and should be read throughout with that point in mind.

Every estimate of voting participation is, in effect, a ratio between a numerator and a denominator. Errors in estimates may occur because of errors in the numerator, the denominator, or both. Problems with the numerator include the following: (1) The reported vote cast may have been heavily inflated by fraudulent ballot-box stuffing, as for example in Plaquemines Parish, Louisiana, in 1844, or in Kansas City, Missouri, between 1934 and 1938; (2) the stated vote may be only a fraction of the real vote cast, either because of fradulent suppression of returns, other forms of pressure on the electorate, or failure of subdivisions to report within the legal time limit (the latter very frequently occurring in Texas); (3) more or less major compiling or reporting errors, without fraudulent intent, may exist, and clearly did in a number of cases in the nineteenth century; and (4) available returns may be significantly fragmentary because the original records were lost.

Problems with the denominator, i.e. the population base, relate primarily to its derivation. Information which has been compiled into the denominator falls into the following classifications: (1) Age cohorts; (2) sex by age for and following every point at which women were enfranchised by State law or by the Nineteenth Amendment; (3) race, which substantially means adding the Negro adult male population to the denominator base in 1868 (ten Southern States) or 1870; (4) citizenship status, reported separately as "male citizens" in 1870, and in more detail beginning with the 1900 census.

The following possible elements of a denominator have not been compiled, though they have entered into State legislation regulating eligibility to vote: (1) Literacy of the adult male/adult population; (2) taxpaying components of the adult male/adult population; (3) other components (for example, the total number registered) which define those legally entitled to vote at any given time. There are two reasons for such exclusions: Many of such devices were deliberately employed, particularly between 1890 and shortly after 1960 , to violate the letter and the spirit of the Fifteenth Amendment; and they are extremely heterogeneous-for example, some States have registration reporting covering all jurisdictions, some do not, and the times for which such information is available are extremely diverse.

The four major components of the denominator, the estimated eligible population, alone can be developed more or less accurately for all States and time periods but even these have very significant problems. In general, the denominator estimates are much more precise from 1900 on than they are for years prior to that date. The reason for this lies in the changing nature of census reporting of critical components which enter the calculation.
Age cohorts. From 1870, the adult male/adult population is specifically enumerated so that the whole number of those 21 years old and over can be stated. This was not the practice earlier. Procedures followed here were to sum all white male age cohorts entirely above 21, and to add to that sum a fraction of any age cohort which bracketed that age, i.e., which included both males above and below 21 years. The fraction was derived by a simple division of the relevant bracketed age grouping, and addition of the quotient to the sum already derived. For example: The 1820 census yields free white male age classifications of $16-25,26-44$, and 45 and over. For Maine in that year, the total number of free white males 26 and over was

46,920. The total number falling in the $16-25$ age classification was 28,530 . There being ten years in that classification, symmetrically divided five ( $16-20$ ) and five (21-25), figure of 28,530 was divided by two, yielding 14,265 ; this was, in turn, added to the sum of free white males 26 and over $(46,920)$ to produce a total estimated electorate of 61,185 . (The figure of 61,185 is too precise but serves to provide the basis from which such estimates could best be derived; the procedure for dividing bracketed age classifications in the census arbitrarily presupposes a linear or uniform age distribution among all the years in the grouping. State-by-State actuarial estimates for this period could easily permit a different procedure. The effect of the procedure used is, unquestionably, to inflate the denominator from its "true" value and thus to generate a lower turnout figure than was actually achieved in these years.)
The following table indicates the bracketed age cohorts and the criteria for division and compilation:

Age Cohorts in the United States Census, 1790-1860 a

a Throughout, the basis is that of free white males. This excludes a small fraction of free Negroes who were at least nominally entitled to vote in several States. No estimate of citizenship exists except for 1860.
b The procedure for estimation in 1790 is a simple transfer from 1800 data: The proportion in each State of the total free white male population of age 16 and over which is estimated to be of age 21 and over.
Sex components. Women were universally enfranchised in 1920, but a number of States gave women suffrage earlier. In order of enfranchisement, the States which extended suffrage to women before 1920 were: Wyoming, as territory, 1869; Colorado, 1893; Utah, 1896; Idabo, 1897; Washington, 1911; California, 1911; Oregon, 1913; Arizona, 1913; Kansas, 1913; Montana, 1914; Nevada, 1914; Illinois, 1916, presidential only; Michigan, 1918; and New York, 1918. In all cases, appropriate sex-related adjustments were made in the denominator effective with the first election to which they applied.
Racial components. Negroes were enfranchised in ten Southern States effective with the 1868 election and nationally by the Fifteenth Amendment (1870). Prior to 1868, the proportion of free Negroes allowed to vote at all was extremely small; and the States in which they were allowed to vote had very small Negro populations. No effort, therefore, has been made to include a component for other than white races in the denominator prior to 1868/70. In Vermont, Maine, Massachusetts, and New York this means a tiny defation of the denominator from its probable true value, and an equally small overestimation of the participation rates prior to 1870.
Citizenship components. This element represents the most difficult of the four major denominator components to estimate for the period prior to 1890-1900, for the following reasons: First, the 1928 election was the first presidential election in which American citizenship was a universal prerequisite for voting. In particular, the period from about 1840 through about 1910 was one in which a considerable number of States permitted aliens (those who had filed first papers, as a rule) to vote in elections. Every effort has been made here to identify by State and at what times these were legally qualified to vote. The denominator is thus grounded in part upon a legal definition which is heterogeneous across space and, for the States in which aliens were once allowed to vote, across time as well.
Second, the population census during most of the nineteenth century is not helpful in decomposing the foreign-born population, when reported, by citizenship status. Prior to 1870, no basis for estimation exists at all from the census materials. In 1870, males of 21 and
over are reported in two columns, one of which specifies male citizens, Combining this with analysis of the size of the foreign-born component of the voting-age male population, certain probable inferences can be made about the proportion of foreign-born males of legal age who had been naturalized, and about these compared with later censuses for which specific proportions are reported. No help is given on this question in the 1880 census. The 1890 census (Population, part II, p. lxvi) gives a percentage breakdown by State of the foreign-born population by status: Naturalized, first papers, aliens, unknowns. From 1900 onward, census figures are provided for these categories in absolute numbers.
A period of particular difficulty in estimation lies between 1850 and 1890. Prior to 1860 no effort is made to decompose the denominator (population base) estimate by citizenship. For 1860 and the years interpolated to 1870 , the same proportion of citizens over 21 to all males over 21 which the 1870 census employs is used to derive the estimated potential electorate of 1860 . Where proportions exist for 1890 and 1870 and the State requires citizenship status of its voters through this period, the mean of the two proportions is used for estimating the 1880 proportion and thus the denominator, Where States permitted alien voting, an effort was made to estimate the proportion of naturalized and first-paper foreign-born to all foreign-born for 1870, based upon the mean of 1890 and 1900 proportions. No such refinements were made for 1860.
There is some reason to believe that these proportions were relatively stable, particularly in States where the frontier stage of settlement had passed. With the raw figures of the 1870 census and the percentage decomposition of foreign-born males of voting age in 1890, the general outlines of this stability can be seen in the example of Ohio. In 1870, citizen males constituted 92.4 percent of the total male population of voting age; in 1890, 93.7 percent; in 1900, 94.4 percent. ${ }^{2}$ From this an interpolated estimate of 93.1 percent was derived for 1880 , and the 1870 figure, 92.4 percent, was used to calculate the estimated eligible electorate of the 1860 voting-age male population.

Distribution of Ohio Male Population of Voting Age, 1890-1910

| Year | Citizens |  |  | Aliens | Total malos 21 and over |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Native white | Naturalized | Negro |  |  |
| 1890--.-- | $\begin{aligned} & \begin{array}{c} 6.0 \\ 78.8 \\ 76.5 \end{array}, 8 \end{aligned}$ | $\begin{array}{r} 15.1 \\ 13.0 \\ 9.6 \end{array}$ | $\begin{aligned} & 2.6 \\ & 2.6 \\ & 2.7 \end{aligned}$ | 6.3 | 1.016.464 |
| 1910----- |  |  |  | 5.6 11.2 | 1,212, 293 |

States which permitted alien suffrage and subsequently abolished it are presented below, with the effective year of abolition so far as is known.

Alien-Suffrage States

| State | Effective year of abolition | State | Effective year of abolition |
| :---: | :---: | :---: | :---: |
| ${ }_{\text {Arkangas }}$ Colorado | 1925 | Nebraska- |  |
| Illinois-- | 1802 180 | North Dakota | 1898-1902 |
| Indiana | 1921 | Oregon | 1914 |
| Michigan | 1857 1894 | South Dakota | 1918 |
|  | 1896 |  |  |

The problems of estimation are clearly more acute in the citizenship area than in any other. The figures presented here are to be considered provisional and subject to revision; no claim is made that the denominators and the participation estimates derived from them are the best

[^235]possible estimates. Limited explorations suggest that the probable margin of error in turnout estimates-at least for States requiring citizenship qualifications-is well under 1 percent for the 18701900 period.

One final remark about method involves the ratio between numerator and denominator. In the absence of any better estimation, the biennial figures are compiled throughout on the basis of linear interpolation between one decennial census year and the next. Obviously, patterns of population growth and decline are never perfectly linear and may deviate widely from that assumption. This is particularly visible as a problem in the "mining-camp" States of the West, especially in Nevada before World War I. A metal lode was discovered at a point in time following a census. Voting-age males poured into the State until the lode was exhausted; and then they left. All of this produced extreme deviations of empirical population realities from any linear model, with resultant wild fluctuations in turnout. Fortunately, the linear model does not appear sharply inconsistent with reality in well-settled States. In any event, no known alternative to it appears to exist throughout most of American political and demographic history except in those few States which published adequate censuses falling between Federal census years.

## Y 79-186. General note.

The election of the President of the United States is provided for in the Constitution, article II, section 1, through the establishment of an electoral college in each State, for each presidential election. The method of casting the electoral vote was modified in 1804 by the adoption of the 12 th amendment to the Constitution. The number of electors, and therefore of electoral votes, is "equal to the whole number of Senators and Representatives to which the State may be entitled in Congress." Because of the varied practices in choosing electors in earlier years, the record of popular votes is inadequate to explain the elections until after 1824.

In four elections the entire electoral vote of certain States remained uncast: (a) 1789-no electoral vote was cast in New York because the legislature failed to agree on electors; (b) 1864-no vote in Confederate States (Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North and South Carolina, Tennessee, Texas, and Virginia); (c) 1868-no vote in Mississippi, Texas, and Virginia because these States had not yet been "readmitted" to the Union; (d) 1872--the vote of Arkansas was rejected, the count of the popular vote in Louisiana was disputed, and the votes of both sets of electors were rejected by Congress.

Source: 1860-1900, Congressional Record, vol. 45, 61st Congress, 2d Session, 1910, p. 4931, except for series 187, 1892-1924, from Louise Overacker, Money in Elections, Macmillan Company, New York, 1932, p. 73; 1928-1944, Louise Overacker, Presidential Campaign Funds, Boston University Press, 1946, p. 32; 1948, William Goodman, The Two Party System in the United States, D. Van Nostrand Company, Inc., New York, 1956, p. 517 (copyright); 1952-1968, Citizens' Research Foundation, Princeton. Data presented in History of American Presidential Elections, 1789-1968, vol. IV, Arthur M. Schlesinger, Jr., Editor, McGraw-Hill Book Co., New York, 1971 (copyright).

Figures represent spending by all national level committees, but not by the candidates themselves. Figures for Republicans, 1912, and Republicans and Democrats, 1916-1944, include amounts transferred to the States as well. National-level committees proliferated after 1940, when the Hatch Act limitation of $\$ 3$ million on the expenditures of a single committee and the $\$ 5,000$ limitation on individual contributions went into effect.

For campaigns from 1860 to 1912, figures are estimates at best. For 1912 and later campaigns, figures are relatively reliable. Although the value of the dollar shrank and the voting population expanded more than fourfold from 1912 to 1952, the cost per vote was 19 cents in both of those campaigns. Between 1912 and 1952, however, the cost per vote fluctuated widely. By 1968, the cost per vote had increased to 60 cents.

## Y 189-198. Congressional bills, acts, and resolutions, 1789-1970.

Source: U.S. Congress, Calendars of the U.S. House of Representatives and History of Legislation; Library of Congress, Legislative Reference Service, unpublished tabulations; U.S. Congress, Congressional Record, various issues.

Some measure of the activities of the U.S. Congress can be gained from the number of bills and resolutions which have been introduced in Congress and from the number of public and private laws which have been passed. The abrupt reduction in the number of private bills enacted into law beginning with the 60th Congress was the resuit of combining many private bills, particularly pension bills, into omnibus enactments.

## Y 199-203. Congressional bills vetoed, 1789-1970.

Source: U.S. Congress. Senate Library, Presidential Vetoes, U.S. Government Printing Office, 1969, p. v, and Calendars of the U.S. House of Representatives and History of Legislation, annual issues.
The term "veto," which does not appear in the Constitution, indicates the action of the President when he disapproves a bill and returns it with his objections to the House of Congress which originated the measure. These regular vetoes differ from pocket vetoes, which result when a bill fails to become law because the President has not signed it within 10 days but cannot return it with objections because the Congress has adjourned during the same period. For a bill to pass over a veto, both Houses of Congress must vote to override the veto.

Source: 1st to 74th Congress, Library of Congress, Legislative Reference Service, 'Political Trends-Both Houses of Congress-1789-1944" (typewritten tabulation based on Encyclopedia Americana, 1936 edition, vol. 7, pp. 516-518, 1st to 69th Congresses; and on Harold R. Bruce, American Parties and Politics, 3d edition, Henry Holt and Co., New York, 1936, pp. 174-179, 70th to 74th Congresses); 75th to 91 st Congresses, U.S. Congress, Congressional Directory, annual volumes.

It is generally recognized today that popular government operates only through the agency of organized political parties. During the early development of the United States, party alignments and the function of political parties were neither fully appreciated nor provided for. Party alignments developed during the formative period, but designations for the different groups were not firmly fixed.

In the classification by party, the titles of parties during early years have been so designated as to be recognizable in the records of the periods concerned, and also to show the thread of continuity which tends to run from early alignments into the present 2-party system. Inasmuch as the party of Thomas Jefferson (generally known at the time as the Republican party) has with a considerable measure of continuity survived to the present time as the Democratic party, the name later accepted by the Jeffersonian Republicans of "Democratic-Republican" is used in the tables to avoid any confusion of the early Jeffersonian Republican with the present-day Republican party. Opposed to the early Republican party was the Federalist party, which was dominant in the first national administration and which, with interruptions, can be traced tenuously by elements of popular support through the National Republican, the Whig, and the Free Soil parties to the Republican party of today.

## Y 215-271. General note.

The number of members in the House of Representatives is fixed by the Congress at the time of each apportionment. The population figures used for apportionment purposes are those determined for the States by each decennial census. No reapportionment was made following the 1920 census, and no change in total House membership has been made since 1912. However, the legislation granting statehood to Alaska and Hawaii allotted one Representative to each of those States and, during 1960 to 1962, increased the total of members to 437 . The total reverted to 435 after reapportionment following the 1960 census. The original assignment of Representatives for each State, to be in effect until after the first enumeration of the population, and the requirement that each State have at least one Representative are stated in the Constitution.
Prior to the passage of the 14 th amendment, Representatives were apportioned among the States "according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons." (Art. I. sec. 2.) In effect, censuses between 1790 and 1860 included threefifths of slaves in the apportionment population. Since the passage of the 14th amendment in 1868, Representatives have been apportioned "among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed." At the time of the 1940 apportionment, it was determined that there were no longer any Indians who would be classed as "not taxed" under apportionment law.

In 1970, for the first time, the following classes of persons abroad were allocated to their home States for inclusion in the apportionment population: (1) members of the Armed Forces; (2) civilian employees of any Federal department or agency who were citizens of the United States or who had a home State; (3) spouses and children who were living abroad with persons classified in groups 1 and 2 above; and (4) other relatives living abroad in groups 1 and 2 who were citizens of the United States or who had a home State.
For detailed information about apportionment methods, see House Report 91-1814: The Decennial Population Census and Congressional Apportionment, 1970.

## Y 215-219. Apportionment of Representatives among the States, 1790-1970.

Source: U.S. Bureau of the Census, U.S. Census of Population: 1970, vol. I, p. VIII.
See general note for series Y 215-271 for information about the apportionment population.

## Y 220-271. Apportionment of membership in House of Representa-

 tives, by State, from adoption of Constitution to 1970.Source: U.S. Bureau of the Census, U.S. Census of Population: 1970, vol. I, p. 53.

Membership is shown as of the date of the fixing of the new House apportionment plus members added for new States admitted during the subsequent decade. Major boundary changes affecting State representation in the House occurred in 1820, when Maine separated from Massachusetts, and in 1863, when West Virginia separated from Virginia.

Prior to 1850, apportionment ratios were chosen arbitrarily; from 1850 to 1900, ratios were the apportionment population of the United States divided by a predetermined number of Representatives; from 1910 on, apportionment ratios were computed by dividing a fixed number (435) of Representatives into the apportionment population. For additional information, see general note for series Y 215-271.

${ }^{1}$ A majority of the popular vote was necessary for a choice. In case of a failure to elect, the legislature supplied the deficiency.
a majority of votes was necessary for a choice. In case of a failure to elect 1 or more electors a second election was held by the people, at which choice was made from the candidates in the first election who had the most votes. The number of candidates in the second election was limited to twice the number of electors wanted.
${ }^{3} 1$ district chose 6 electors; 1,5 electors; 1, 4 electors; 2, 3 electors each; and 1 , elector.
4 A majority of votes was necessary for a popular choice. Deficiencies were filled by the General Court, as in 1792 . It also chose 2 electors at large. In 1796 it chose 9 electors, and the people, 7 .
s 2 of the districts voted for 5 members each, and 2 for 3 members each. A majority of votes was necessary for a choice. In case of a failure to elect by popular vote the General Court supplied the deficiency. In the election of 1792 , the people chose 5 E Each of the 8 districts chose 2
legislature) selected 1 . It also elected 2 electors at large

71 district elected 3 electors; 2, 2 electors each; and 27, 1 elector each. The 34 electors thus elected chose 2 presidential electors. 3 electors who received most votes 8 Each qualified voter voted for 1 elector. The 3 electors who received most votes in the State were elected.
91 district chose 4 electors; 1, 3 electors; 1,2 electors; 1,1 elector.
10 During the years 1804-1828, Maryland chose 11 electors in 9 districts, 2 of the 10 During the years $1804-1828$, Maryland chose 11 electors in 9 districts, 2 of the
districts elected 2 members each.
11 The State was divided into 4 districts, and the members of the legislature residing in each district chose 3 electors.
122 districts chose 5 electors each, and 1 chose 4 electors.
${ }_{13}$ Each district elected 4 electors.
${ }^{14}$ In 1796 and 1800 , Tennessee chose 3 presidential electors- 1 each for the districts appointed by the legislature, and the "electors" residing in each of the 3 districts appointed by the legisiature, and the "electors" residing in each of the 3 districts

Series Y 27-78. Voter Participation in Presidential Elections, by State: 1824 to 1968-Con.
[In percent]

Mississippi, Texas, and Virginia did not participate in the election.
Confederate States did not participate in the election.

3 Florida (in 1868) and Colorado (in 1876) cast 3 Republican electoral votes through
ts legislature rather than by popular vote.
4 South Carolina chose its electors through its legislature.

Series Y 79-83. Electoral and Popular Vote Cast for President, by Political Party: 1789 to 1968

See footnotes at end of table.

Series Y 79-83. Electoral and Popular Vote Cast for President, by Political Party: 1789 to 1968-Con.

- Represents zero.
${ }^{1}$ Total vote for Gregory includes write-in votes as well as votes for the Freedom and Peace Party, the Peace Freedom Alternative, the Peace and Freedom Party, and the New Party
${ }_{2}^{2}$ Total vote for McCarthy includes write-in votes as well as votes for the Alternative in November Party, and the New Party.
${ }^{3}{ }^{3}$ Democratic electors in Alabama, all 8 unpledged Democratic electors in Mississippi, and 1 Republican elector in Okiahoma voted for Senator Harry F. Byrd.
${ }_{5} 1$ Democratic elector in Alabama voted for Walter Jones.
Bryan.

6 Greeley died shortly after the election and presidential electors supporting him cast their votes as indicated, including 3 for Greeley, which were not counted.
Whig tickets were pledged to various candidates in various States.
${ }^{8}$ No candidate having a majority in the electoral college, the election was decided in the House of Representatives.
${ }^{3}$ Prior to the election of 1804 , each elector voted for 2 candidates for President; the one receiving the highest number of votes, if a majority, was declared elected President, the next highest, Vice President. This provision was modified by adoption of the 12 th amendment, which was declared ratified by the legislatures of three-fourths of the States in a proclamation of the Secretary of State, Sept. 25, 1804 .

Series Y 84-134. Electoral Vote Cast for President, by State and Political Party: 1804 to 1968
[Electoral votes are given for the period following the revision of the method of election in 1804, using these letter symbols for the various political parties: A-American; AJAnti Jackson; AM-Antin-Masonic; C-Coalition; CU-Constitutional Union; D-Democratic; DR-Democratic-Republican; F-Federatist; N-Nullification; NR-
National Republican; PP-People's Party; PR-Progressive; R-Republican; SD-Southern Democratic; SR-States' Rights; W-Whig. In the 1824 election, party lines were so indistinct that names of the individual candidates have been used]

Series Y 84-134. Electoral Vote Cast for President, by State and Political Party: 1804 to 1968—Con.
[Electoral votes are given for the period following the revision of the method of election in 1804, using these letter symbols for the various political parties: A-American; AJ-
 lines were so indistinct that names of the individual candidates have been used]

# Government Employment and Finances (Series Y 272-848) 

## y 272-848. General note.

Governmental services in the United States are provided through a complex organizational structure made up of numerous public bodies and agencies. In addition to the widely recognized pattern of Federal, State, county, municipal, and township governments, there exist many offshoots in the form of single-function and multiplefunction districts, authorities, commissions, boards, and other entities that have varying degrees of autonomy. The basic pattern differs widely from State to State. Within a particular State, the various classes of local units may also differ in their characteristics.

Identification and enumeration of governmental units is, of course, a prerequisite to comprehensive reports on their activities. Thus, the U.S. Bureau of the Census report, Census of Governments, 1967, vol. I, Governmenial Organization, provides information on numbers of governmental units by type, size, and location.

The summary historical table from the 1967 Census of Governments, reproduced below, presents the numbers of different types of governmental units for $1942,1952,1957,1962$, and 1967.

Table I. Governmental Units, by Type: 1942 to 1967

| Type of government | Number of units |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1967 | 1962 | 1957 | 1952 | 1942 |
| Total | 81,299 | 91,237 | 102,328 | 116,743 | 155,116 |
| U.S. Government. |  |  |  |  | 1 |
| States-.... |  |  |  |  |  |
| Municipalities, | 18,048 | 18,000 | 17,183 | 16,778 | 16,220 |
| Townships and towns. | 17.105 | 17,142 | 17,198 | 17,202 | 18,919 |
| School distriets- | 21,782 | 34,678 | 50,446 | 67,346 | 108,579 |
| Special districts_ | 21,264 | 18,323 | 14, 405 | 12,319 | 8,299 |

Comparable data for the number of governments are not available for earlier years, principally because definition of the concept of "a governmental unit" and enumeration of the units in existence are beset with many difficulties. Professor William Anderson of the University of Minnesota has done extensive work in this field, and the enumerations by the Bureau of the Census in 1942 and later reflect his contributions.

Anderson's monograph, The Units of Government in the United States: An Enumeration and Analysis, first published in 1934 and revised in 1936, was extensively revised in 1942 and finally republished in 1945 with an appendix comparing the author's enumeration of governments with that of the 1942 Census of Governments. (Public Administration Service, Chicago, 1945.) Anderson reported 175,418 governments in the United States in 1930-33 and 165,049 in 1941. The 1942 Census of Governments adopted a more selective definition, eliminating 9,729 school districts and 204 other units from enumeration as separate entities. Anderson reported that he had 'good reason to believe that the Bureau's figures represent a more accurate enumeration." (Source cited above, p. 48.)

The comparative totals reported by Anderson, on the basis of his definitions and procedures, are summarized in table II.

A governmental unit as defined in the 1967 Census of Governments (Governmental Organization, cited above, p. 13) is as follows:

A government is an organized entity which, in addition to having governmental character, has sufficient discretion in the management of its own affairs to distinguish it as separate from
the administrative structure of any other governmental unit. To be counted as a government, any entity must possess all three of the attributes reflected in the foregoing definition: Existence as an organized entity, govermmental character, and substantial autonomy.

Characteristics taken as evidence of the "essential attributes" of a separately existing governmental unit include organization, active operation, and the possession of specific corporate powers; the popular election or appointment of officers; the power to levy taxes or to issue debt that bears interest exempt from Federal taxation; responsibility for performing a function commonly regarded as governmental; public accountability; and considerable administrative and fiscal independence.

Despite the variety and apparent simplicity of these criteria, the proper classification of some local governmental entities remains doubtful and, in such cases, account has been taken of (a) local attitudes as to whether the type of unit involved is independent, and (b) the effect of the classification upon the collection and presentation of statistics of governmental finances and employment.

Table II. Governmental Units, by Type: 1930-33 and 1941

| Type of government | 1941 | 1930-38 | Chanke in number |
| :---: | :---: | :---: | :---: |
| Total | 165,049 | 175,418 | $-10,369$ |
| U.S. Government | 1 | 1 | - |
| States... | 48 | 48 | - |
|  | 3,050 | 3,053 | -3 |
| Incorporated places (cities, villages, ete., and D.C.) | 16,262 | 1.6,360 | --104 |
| Towns (as in New England) and organized townships (in a total of 23 States) | 18,998 | 20,262 | $-1.264$ |
|  | 118,308 | 127,108 | $-8.800$ |
| Other units | 8,382 | 8,580 | -198 |

- Represents zero.

Two broad categories of governmental units may be distinguished -special-purpose organizations, such as school, park, and sanitary districts; and general-purpose governments, each with a broad spectrum of powers and duties, ranging in size from small village and town governments to the large metropolitan city, State, and Federal governments.

These diverse units can be represented by at least two kinds of measures that are universally applicable: (a) the number of persons serving in each governmental unit and their compensation, and (b) the broad financial aspects of the operations, as represented by revenues, expenditures, and indebtedness. The collection and reporting of such data are complicated by the large numbers and frequent changes of the governmental units to be covered, by changes (often unrecorded) in their internal structures and external relationships, and by the great diversity that exists in organizational forms, employment relationships, financial procedures, the adequacy and availability of records, and the categories and terminologies used in those records and in public reporting. For the most part, data for the Federal Government are derived from regular personnel and fiscal reports, published annually or oftener. Those for the States and large cities are compiled from annual public reports or other official records of each unit and its component organizational subdivisions; and those of other local governments are derived from surveys based on similar reports and records of carefully selected samples of each type of government.

Complete censuses of governments, covering governmental structure, personnel, expenditures, revenues, debt, and other selected aspects of all governments in the United States, were conducted for 1932, 1942, 1957, 1962, and 1967. Earlier periodic censuses (for decennial years for $1850-1890$ and for 1902,1912 , and 1922) were narrower in scope, particularly with reference to expenditures and personnel.

The various censuses of governments and also the annual reports on personnel and finances, differ not only in completeness, but also in some of the basic concepts and classifications. Consequently, the preparation of historically comparable data covering all governmental units is extremely difficult. As is evident in the historical series for the Federal Government, events and changing concepts greatly affect the comparability, over long periods, of data for a single government. The problem of continuity in concepts and classifications is greatly multiplied in summaries for all governmental entities.
For such reasons, the consolidated historical series now available are for selected years beginning with 1902. The data available for earlier years are either inadequate for classifications now used or require more extensive reworking than could be achieved with available resources.
State and local government data in this chapter include Alaska and Hawaii for years after admission as States; they omit outlying areas of the United States. The District of Columbia is classified as a local government.
For references to publications containing the original data and statistics for individual State and local governments, see text for series Y 652-848.
For still another approach to the role of Government operations in the economy, see series F 66-70, reporting Government purchases of goods and services, in which the Federal Government totals for 1938-1970 are subdivided between national defense and other purposes. For national income originating in "Government" as an industry, see series F 141; and for estimates of "Government product" in the national income accounts, see series F 129.

## Y 272-334. General note.

Statistics on government employment and payrolls in the United States appear in The Trend of Government Activity in the United States Since 1900 , by Solomon Fabricant, assisted by Robert E. Lipsey, National Bureau of Economic Research, New York, 1952, pp. 161-203. Fabricant and Lipsey relate their figures to the government employment data for 1929-1949 and earlier periods published by the Office of Business Economics and predecessor agencies. The latter figures differ from the former chiefly in omitting, for national income accounts, all Federal Government employees abroad. Also differentiated are earlier estimates prepared for the National Bureau of Economic Research by Simon Kuznets in National Income and Its Composition, 1919-1938, New York, 1941, vol. II, pp. 811-826. This study did not have data from the Work Projects AdministrationBureau of Labor Statistics compilations noted below. For reference to other studies for earlier years, see text for series Y 332-334.

The WPA-BLS figures, mentioned above, cover 1929-1939. They were obtained as part of a larger survey of State and local governments conducted in 1938-1943 by the Bureau of Labor Statistics and financed and staffed by the Work Projects Administration. Annual estimates of employment and payrolls of State and local governments and the underlying detailed estimates of States, by classes of governments and major fields of employment, were published by the Bureau of Labor Statistics in Employment and Pay Rolls of State and Local Governments, January 1946.

Sample surveys by the Bureau of the Census began in 1940 on a quarterly basis, giving reports of January, April, July, and October data. School data prior to 1946 were from the Office of Education and reported only for State and local aggregates, so that pre-1946 detail by level and type of government relates only to the nonschool data.

State-by-State estimates were issued by the Bureau of the Census at least once a year from the early 1940's, except for 1951. Summary data were provided on the school (education) component, but other functional detail was supplied only for State and municipal governments until 1952. Development of separate payroll figures on fulltime employees was begun in 1951, and derivation of employment figures on a full-time equivalent basis was initiated in 1952. Beginning with 1953, national and State-by-State data have been reported by function, on the full-time equivalent number of employees of State and local governments for the month of October (except 1957 data, which were for April).

Beginning with 1955, the Bureau of Labor Statistics assumed responsibility for providing monthly statistics on government employment and payrolls.

Both series Y 272-289 and Y 332-334 cover all types of specialpurpose districts as well as general-purpose local governments and all branches of the State governments; and both include the employees of government utilities as well as of general government services and agencies. Education employment includes noninstructional staff and the educational employees of State as well as local governments. Both tabulations omit military personnel and persons on work relief.

Federal Government employment and payrolls for 1952-70, series Y 273 and $\Psi$ 291, respectively, are derived from Civil Service Commission data. Prior to 1952, these figures (Y 273 and 291) are basically the Bureau of Labor Statisties figures and, therefore, differ in coverage and date from the Civil Service Commission's historical tabulations for the Federal Government alone (series Y 308-317).

Differences from labor force data.-Data collected from the governmental employers, such as the Bureau of the Census and Bureau of Labor Statistics compilations on public employment referred to above, necessarily differ from government employment statistics derived from broad surveys of the labor force (see, for example, series Y 332-334).

Data on the labor force, and therefore on government workers, are collected by the Bureau of the Census in monthly surveys and published in its Current Population Reports. These surveys involve direct personal interviews with selected samples of households throughout the Nation. Governments are listed as an industry group, and members of the labor force who report that they are government workers are so classified.

## Y 272-307. Public employees and government monthly payrolls, by

 type of government, 1940-1970.Source: 1940-1967, U.S. Bureau of the Census, U.S. Census of Governments: 1967, vol. 6, No. 5, Historical Statistics on Governmental Finance and Employment; 1968-1970, Public Employment, annual issues.
Data on Federal employment and payrolls were obtained from the Bureau of Labor Statistics (BLS) prior to 1952 and the Civil Service Commission since that time. BLS figures were based on Civil Service data. Substantially all basic data for State and local governments were collected by mail surveys of the Bureau of the Census. However, prior to 1946, data on school employment were derived from the U.S. Office of Education publication, Biennial Survey of Education in the United States.
The reports on public employment outline the development of the Bureau of the Census reporting of statistics on public employees and payrolls, record data for the years back to 1940, and provide information on the concepts and definitions used. Additional data on Federal, State, and local governments are contained in the U.S. Census of Governments: 1957, vol. 2, Governmental Employment; the U.S. Census of Governments: 1962, vol. 3, Compendium on Public Employment; and the U.S. Census of Governments: 1967, vol. 3, Public Employment.

Public employees, as defined for the purpose of the Bureau of the Census survey of government employment, include all paid officials and civilian employees of Federal, State, and local governmental units. Employees of contractors, persons working on a contract
basis, and persons on work relief are not considered public employees. The term, however, does include fee officials, paid volunteer firemen, student help, and other persons employed on a part-time basis even though they may receive only nominal compensation for their services. Military personnel and their pay are omitted.

Figures for full-time equivalent employees, series Y 273-289, represent the number of persons that could have been employed, for the payroll amounts reported, if all personnel were engaged on a full-time basis at the average monthly rates applying to full-time workers for the particular functions and levels of government involved. Full-time employees are those persons employed during the pay period for the number of hours per week prescribed for full-time work in the jurisdiction concerned. The term includes temporary and emergency employees working on a full-time basis during the pay period.
Payrolls, series Y 290-307, include salaries, wages, fees, and other compensation earned in the calendar month by officials and other employees. Amounts reported are gross pay before deductions for withholding taxes, retirement contributions, social security, and other purposes. Full-time payrolls, series Y 292-307, are amounts paid to full-time employees as defined above.
Figures for State governments include, in addition to data for the regular departments and agencies, data for boards, commissions, authorities, institutions of higher education, and other semiautonomous agencies of State government. State employees include all persons paid by the State government.
Figures for municipalities (series Y 283-284 and Y 301-302) are for city, borough, village, and-except in New England, New York, and Wisconsin-town governments. They include boards, commissions, and semiautonomous districts and authorities controlled by such governments, as well as the regular municipal departments and agencies. In a number of States, some or all of the public schools serving city areas are operated by city governments, and city figures include their employees.

Figures for counties (series Y 285-286 and Y 303-304) include data for semiautonomous county agencies and for public schools or school facilities operated by county governments in a few of the States.
Data on school districts are restricted to independent districts operating public schools. They do not include data for school systems operated by State, city, county, or township governments. Between 76 and 81 percent of all local government education employees in October of each year, 1946-1970, were employees of independent school districts.

In addition to townships of the Midwestern States, which have limited governmental functions and play a minor role, township data include figures for New England, New York, and Wisconsin towns, and Pennsylvania and New Jersey townships, where town and township governments are important in the local government structure. The New England town figures include school information for four States (all except New Hampshire and Vermont) in which town governments administer public schools. Data on special districts are for special-purpose units of local government set up to perform a specific service or services in a local area, but which are administratively and fiscally independent of the broader types of local government having jurisdiction in the area. These units range in size from drainage districts and other agricultural-resources districts having only intermittent activity or employment up to such entities as the Chicago Transit Authority, the Port of New York Authority, and other large-scale governmental employers.

## Y 308-317. Paid civilian employment of the Federal Government, 1816-1970.

Source: U.S. Civil Service Commission, unpublished data.
The data for 1816-1891 were compiled by the Civil Service Commission from Official Register of the United States; for 1901-1911, from the Annual Report of the Civil Service Commission and Official Register; for 1908-1970, from the Civil Service Commission, Annual Report and Federal Civilian Manpower Statistics, formerly titled

Monthly Report of Federal Employment, and supplemented throughout by Civil Service Commission records.
Prior to 1938, the data are for employees on the rolls, with or without pay; for 1938-1942, the number on the payroll with pay; and for 1943-1970, the number in active duty status.
Employees and officials of the legislative, judicial, and executive branches are included. Employees of the District of Columbia are not included; they are considered employees of a local government.
The figures exclude military personnel but include civilian employees of the military departments. However, mechanics and other workmen at army arsenals and navy yards are not included prior to 1881.
The data for the Post Office, series Y 314, exclude contractors but include substitutes, partly estimated.

Series Y 311 represents personnel employed under the act of January 16, 1883, establishing the Civil Service Commission and the competitive (classified) service. This service includes all civilian positions in the executive branch of the Federal Government that are not specifically exempted by or pursuant to statute, or by the Civil Service Commission. It also includes all positions in the legislative and judicial branches which are specifically made subject to the civil service laws by statute. Figures represent positions, including vacancies, prior to 1947; since 1948, they represent employees serving under competitive appointment, primarily in the executive branch.

Y 318-331. Paid civilian employment in full-time positions in the Federal Government, 1948-1970.
Source: U.S. Civil Service Commission, Pay Structure of the Federal Civil Service, table 2, annual issues.
Over the years, the data in this table reflect increased coverage of paid Federal civilian employees. The data for 1948-1951 include only those employees in the conterminous United States; all later data are worldwide figures. Prior to 1954, only executive branch employees are shown; later data include all legislative branch employees except employees of Congress. Employees of the District of Columbia are not included as they are considered employees of a local government. The figures exclude military personnel but include civilian employees of the military departments.

Changes have also taken place over the years in the various employee pay systems. Data on the crafts, protective, and custodial schedule are shown for 1948-1951; some data on a different basis are also available in the annual issues cited above for 1952-1955. After 1955, this schedule was discontinued. The data for the Postal Pay Act do not include postal substitutes as full-time employees until 1953. Postal seasonal Christmas assistants are not included. The data for "other" employees include foreign nationals employed overseas after 1951.

## Y 332-334. State and local government employment, 1929-1970.

Source: U.S. Bureau of Labor Statistics, Employment and Earnings, United States, 1909-71, BLS Bulletin 1312-8, p. 576.
Data for 1929-1939 are derived from a WPA-BLS survey (see general note for series Y 272-334). Figures for 1940-1954 are from Bureau of the Census reports on public employment and for 19551970, from Bureau of Labor Statistics compilations.

These series include regular full-time teachers for the summer vacation period, whether or not they were specifically paid in those months; elected officials of small local units and paid volunteer firemen are omitted as nominal employees.

Series Y 332-334 differ from series Y 274-276 because the former measure average monthly employment, whereas the latter are for October 31 of each year (except for 1957).
For a discussion of studies conducted by Federal agencies, see general note for series Y 272-334. Estimates of employment and payrolls for the years 1909-1927 appear in Wilford I. King, The National Income and Its Purchasing Power, National Bureau of

Economic Research, 1930, pp. 360-365; and for 1926, a study by William E. Mosher and Sophie Polah based on approximately 500 reports from State and local governments, published in "Public Employment in the United States," supplement to National Municipal Review, vol. XXI, No. 1, January 1932.

Relying heavily on the Mosher-Polah article and public employment data issued by the Bureau of Foreign and Domestic Commerce in connection with certain of its national income studies, Simon Kuznets, in National Income and Its Composition, 1919-1938, National Bureau of Economic Research, 1941, vol. II, pp. 811-826, published revised estimates of government employees and payrolls for 1919-1938.

Y 335-338. Summary of Federal Government finances-administrative budget, 1789-1939.

Source: U.S. Department of the Treasury, Statistical Appendix to Annual Report of the Secretary of the Treasury, 1970, pp. 8-13 and 60-61.

Receipts and expenditures for 1789-1915 are based on warrants issued; for 1916-1939, on daily Treasury statements. Total gross public debt is on the basis of public debt accounts for 1791-1915, and on the basis of daily Treasury statements for 1916 to date. For description of the Daily and Monthly Statements of the Treasury, explanation of "warrants issued,"' "public debt accounts," and other pertinent items, see the source, pp. 1 and 2.

The receipts and expenditures data exclude amounts received in trust and expended from trust accounts. They also exclude amounts borrowed through the sale of Government securities and amounts paid to retire public debt. Receipts include the proceeds of sales of some types of Government-owned assets, including land. For recent years, however, proceeds from the disposition of some categories of Government property (including sales of commodities and securities purchased and repayments received on account of loans made by the Government) are reported as deductions from expenditures, rather than as receipts. Postal receipts and expenditures are included net for each year throughout the series; that is, a postal surplus is included in receipts and a postal deficit in expenditures.
Subject to the foregoing qualifications, figures for Federal Government receipts (series Y 335) represent "total receipts" through 1912 and "net receipts" thereafter. In determining net receipts, the following items are deducted from total receipts:

Refunds of receipts, principally for the overpayment of taxes, 1913-1939, are deducted from total receipts. (For earlier years, such refunds are included in expenditures.)

Certain interfund transactions are excluded from receipts and expenditures starting in 1932; for prior years, the amounts of such transactions are insignificant. Refunds of receipts are excluded from receipts and expenditures starting in 1913; comparable data are not available for prior years.

Transfers of tax receipts to the Federal old-age and survivors insurance trust fund from 1937; to the railroad retirement account from 1938.

Capital transfers, consisting of payments to the Treasury principally by wholly owned Government corporations for retirement of capital stock and for disposition of earnings. (Although the exclusion applies to all fiscal years for 1931-1939, the only transfer of this kind identified for that period was an item of $\$ 250$ thousand in 1937.)
Figures for expenditures for 1931-1939 likewise are net of refunds paid and of capital transfers, but include any such payments in earlier years.
The surplus or deficit (series Y 337) is the difference between receipts and expenditures in any fiscal year. The change in public debt during any year is usually determined in large part by the surplus or deficit; it is, however, affected also by the increase or decrease in the Treasury cash balance and by various other financial operations. Consequently, there is only an approximate relationship between
series Y 337 and the year-to-year differences in the debt reported in series Y 338.

For comments on the total gross public debt (series Y 338) and other aspects of the public debt, see text for series Y 493-504.
In a statement on "Some Historical Aspects of Federal Fiscal Policy, 1790-1956" (in Federal Expenditure Policy for Economic Growth and Stability, papers submitted by panelists appearing before the Subcommittee on Fiscal Policy, Joint Economic Committee, 85th Congress, 1st sess., Nov. 5, 1957, Joint Committee Print, pp. 60-83), the official historical series on Federal receipts and expendituressuch as series Y 335 and Y 336 -were characterized by Professor Paul B. Trescott as subject to "certain deficiencies for the economist" stemming in part from "capricious patterns of inclusion and exclusion." Important before 1870, according to Trescott, was lack of conformity between the accounts of the Treasury, which the official data summarize, and the accounts of the collecting and disbursing officers who actually dealt with the public. He reported that the payment of $\$ 28$ million of surplus revenue to the States in 1837 was omitted from Treasury accounts; that more than $\$ 100$ million reported in Treasury figures of expenditures in the Civil War years was accumulated in disbursing officers' balances; and that various other adjustments were desirable. In compiling alternative totals of receipts and expenditures on the basis of various official records additional to Treasury accounts, Treseott has adopted special concepts, so that the resulting totals are designed primarily to measure money-flows. To some extent, his work incorporates a revised expenditure series compiled by M. Slade Kendrick in A Century and a Half of Federal Expenditures, National Bureau of Economic Research, New York, Occasional Paper 48, revised, 1955. Kendrick's data are as nearly as possible on a cash-payment basis for 1917-1952 (see Appendix B, especially p. 67).
The adoption of the unified budget concept reflected in series Y 339-342 was in part designed to eliminate these problems of comparability, but the data have not been worked back prior to 1954. From 1940 to 1953 the consolidated cash data shown in series Y 339342 are closer to the concept currently in use than the administrative budget, while the only official data available for years prior to 1940 are the administrative budget figures.
The differences between the administrative budget and consolidated cash statement were slight prior to the mid-1930's when the Social Security trust funds began. From 1934 to 1939, cash receipts totaled $\$ 30.3$ billion and administrative budget receipts totaled $\$ 26.2$ billion; cash payments totaled $\$ 45.4$ billion while administrative budget expenditures were $\$ 44.9$ billion; the cash deficit totaled $\$ 15.0$ billion and the administrative budget deficit totaled $\$ 18.7$ billion.

Y 339-342. Summary of Federal Government finances, 1929-1970.
Source: U.S. Office of Management and Budget. For all series, 1929-1939, unpublished data. Series Y 339-341, 1940-1970, The Budget of the United States Government, 1973, p. 553. Series Y 342, 1940-1962, Federal Government Finances (unbound mimeographed tables); 1963-1970, The Budget of the United States Government, 1973, p. 543.

The unified Federal budget concept was first introduced in 1968 to incorporate reforms recommended by the President's Commission on Budget Concepts, whose report was published in 1967. Among the principal recommendations of the Commission incorporated into the new unified budget concept are the following:
(1). The Federal budget should include all federally controlled funds-whether labeled "Federal funds" or "trust funds"-so that it provides a picture of the total impact of the government on the economy.
(2). Any privately-owned activities-even if federally chartered -are not to be included in the Federal budget.
(3). Federal receipts shall consist of all income which arises out of the Government's sovereign capacity to govern (that is,
taxes and compulsory payments plus unfettered gifts to the Government). All income derived from business-type activities (such as the sale of public lands) are recorded as negative outlays.
The objective was to provide a consistent, comprehensive overview of total Federal finances regardless of the legal technicalities over who "owns" the money the Federal Government controls.

In order to provide comparable data over a period of years, the Bureau of the Budget (now Office of Management and Budget) and the Department of the Treasury jointly produced a set of data back to 1954. It was felt that the differences from the consolidated cash statement were too minor to warrant the additional work required to produce completely comparable data for earlier years. For most purposes there is no serious discontinuity in using the consolidated cash data for the 1940-1953 period and unified budget data for subsequent years. For example, over the period from fiscal year 1954 to 1958 the consolidated cash receipts averaged only 3 percent higher ( $\$ 1.9$ billion annually) than the unified budget receipts; cash payments averaged $2 \frac{1}{2}$ percent higher ( $\$ 1.6$ billion annually) than unified budget outlays; and the cash statement averaged a $\$ .03$ billion surplus while the unified budget averaged a $\$ .3$ billion deficit.

The consolidated cash statement was the broadest budgetary measure of Federal finances prior to the adoption of the unified budget. It differs from the unified budget primarily for the following reasons:
(1). The cash statement has a much more inconsistent treatment of income from business types of transactions. It treats large amounts of such income as offsets to outlays (called payments in the cash series) whereas other large amounts of such income are included in receipts.
(2). The cash statement includes transactions of wholly pri-vately-owned enterprises (such as the Federal Home Loan Banks).
(3). The cash statement records interest when the cash is paid; the unified budget records interest when it is earned (accrued).

Consolidated cash data for current periods are no longer being produced since the existence of alternative budget concepts creates inordinate confusion.

At the same time that the budget concepts were reformed the debt concepts were also reformed; for many years there were two principal debt concepts: Public debt and debt subject to the debt limit. The public debt is that debt which originates from the Treasury Department. For most of our history this was the total debt, but in the past few decades the Congress has authorized other agencies (such as the Tennessee Valley Authority and the Federal Housing Administration) to borrow money without going through the Treasury Department. As a result, the public debt series does not include several billion dollars worth of Federal debt. The debt subject to limit includes almost all public debt but only part of the agency debt. Hence, a new comprehensive debt series was developed which includes both public and agency debt. This debt series is called "Gross Federal debt" (series Y 342 and Y 488) and data on a comparable basis have been compiled back to 1939. The differences between the gross Federal debt and the public debt (series Y 338 and Y 493) are quite large in the 1939-1944 period because of the large volume of agency borrowing which occurred in the 1930's, particularly in 1934.

## Y 343-351. Federal Government receipts, by source, 1940-1970.

Source: U.S. Office of Management and Budget, Federal Government Finances (unbound mimeographed tables), October 31, 1972.

For 1940-1953, data are consolidated cash totals; for 1954-1970, data are based on the unified budget concept. The cash data are comparable to the unified budget data except for the "other miscellaneous receipts and "total" columns, where the cash receipts include certain transactions that are offset against outlays in the unified budget. In general, these differences have no effect on the surplus or deficit. For further details, see text for Y 339-342.

Y 352-357. Federal Government receipts-administrative budget, 1789-1939.
Source: U.S. Department of the Treasury, Statistical Appendix to the Annual Report of the Secretary of the Treasury, 1971, pp. 8-12, except series Y 356, Annual Report of the Secretary of the Treasury, 1946, pp. 422-423.

See text for series Y 335-338, for a discussion of receipts according to the administrative budget concept.

## Y 358-373. Internal revenue collections, 1863-1970.

Source: U.S. Department of the Treasury, Annual Report of the Secretary of the Treasury, 1929, pp. 419-424; 1946, pp. 406-409; and Statistical Appendix to Annual Report of the Treasury, 1970, pp. 46-51.

The three Annual Reports overlap as to years covered. To the extent that they differ in the grouping of items in any given year, the tabulation shown here generally follows the latest compilation; however, some exceptions are indicated below.

In Historical Statistics of the United States, 1789-1945, series P 109119, the corresponding figures exclude trust fund receipts for 1935-1945. The data shown here for series Y 358-373 follow later Treasury practice by including, among internal revenue collections, all taxes collected by the Internal Revenue Service, whether assigned to general revenue or to trust funds.

These data, from Internal Revenue Service reports of collections, differ from figures shown in other series. The variations reflect differences in the time or stage of operations when the receipts are recorded. Taxes are included in budget receipts when reported in the account of the Treasurer of the United States. Internal Revenue Service reports of collections through 1954 include taxes for which returns (and payments) were received in internal revenue offices. Under arrangements begun in 1950 for withheld individual income tax and old-age and survivors insurance taxes, and later extended to railroad retirement taxes and many excises, these taxes are paid directly into Treasury depositaries. The depositary receipts, issued as evidence of such payment, are attached to quarterly returns submitted to the Internal Revenue Service by employers and taxpayers. Under this procedure, the amounts are included in budget receipts in the month and year when the depositary receipts are issued. Effective July 1, 1954, this accounting practice was extended to Internal Revenue Service reports of collections, so that the reported collections after fiscal 1954 likewise include depositary receipts in the month when the depositary receipts are issued.

Excise taxes paid into depositaries cannot be fully classified in terms of specific taxes until the supporting returns are received. Consequently, the collections shown for designated excise taxes in fiscal years after 1954 are subject to an undistributed adjustment. (For the amounts involved, see Statistical Appendix to Annual Report of the Secretary of the Treasury, 1970, p. 50.)

The principal taxes included in totals but not shown separately are as follows:

1863-1915. Income and profits, largely 1863-1874 and 19141915 (see comments below for series Y 359); corporation excise, 1910-1914; occupational (special) taxes, 1863-1871, 1898-1902, and 1915.

1916-1957. Occupational (special) taxes, 1916-1928; insurance, 1918-1922; soft drinks, 1918-1924; and agricultural adjustment taxes, 1934-1936.
Y 358, total collections. For items included in this series but not shown separately in series $Y$ 359-373, see source publications.

Y 359, individual income taxes. Although not shown separately for 1863-1915, this was an important tax source under revenue legislation enacted during the Civil War. The first collections in 1863 and for other years are shown below as tabulated in the Annual Report of the Secretary of the Treasury, 1929, p. 419.

The income tax legislation of the Civil War period expired in 1871 (see text for series Y 393-411). The collections in 1895 were under an act of 1894 that was declared unconstitutional. This type of tax was not imposed in other years during 1872-1913. The amounts shown in table III for 1873, 1874, 1876, 1881, and 1884 were late collections.

Table III. Individual Income Tax Collections: 1863 to 1895 [In thousands of dollars. For years ending Jume 30]

| Year | Amount | Year | Amount | Year | Amount | Year | Amout |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1895 | 77 | 1874 | 139 | 1870 | 37,776 | 1866 | 72,982 |
| 1884 | 56 | 1873 | 5,062 | 1869 | 34,792 | 1865 | 60,979 |
| 1881 | 3 | 1872 | 14,437 | 1868 | 41,456 | 1864 | 20,295 |
| 1876 | 1 | 1871. | 19,163 | 1867 | 66,014 | 1863 | 2,742 |

Separate figures for the individual income tax collections are not available for 1914, 1915, and 1918-1924.
Since 1951, withheld income taxes and old-age and survivors insurance taxes on employees and employers, and since 1957, disability insurance taxes on employees and employers have been paid into the Treasury in combined amounts without separation as to type of tax. Since June 1965, hospital insurance taxes have been deposited in the same way. Similarly, since 1951 and 1957, respectively, the old-age and survivors insurance and the disability insurance taxes on selfemployment incomes have been paid in combination with income tax other than that withheld. The distribution of these collections by type of tax is based on estimates made in accordance with section 201(a) of the Social Security Act (42 U.S.C. 401(a)). Included in income taxes withheld by employers for 1951-1956 are amounts subsequently transferred to the Government of Guam under an act approved August 1, 1950 ( 48 U.S.C. 1421h). Since 1956 these amounts are excluded.

The relative importance of withholding by employers as a method of income tax collection is shown in table IV for the period since withholding was instituted.

Table IV. Individual Income Tax Collections, by Method of Collection: 1943 to 1970
[In millions of dollars. For years ending June 30]

| Year | Total | Withheld by employers | Other collections | Year | Total | Withheld by employers | Other collections |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1970 | 103,652 | 77, 416 | 26,236 | 1956 | 35,338 | 24,016 | 11,322 |
| 1969 | 97,440 | 70,182 | 27,258 | 1955 | 31,650 | 21,254 | 10,396 |
| 1968 | 78,252 | 57,301 | 20,951 | 1954 | 32,814 | 22,077 | 10,737 |
| 1966 | 61,298 | 42,811 | 18,486 | 1952 | 29,274 | 17,929 | 11,345 |
| 1965 | 53,661 | 36,840 | 16,820 | 1951 | 22,997 | 13,090 | 9,908 |
| 1964 | 54,590 | 39,259 | 15,331 | 1950 | 17,153 | 9,889 | 7,264 |
| 1963 | 52,988 | 38,719 | 14,269 | 1949 | 18,052 | 10,056 | 7,996 |
| 1962 | 50,650 | 36,246 | 14,403 | 1948 | 20,998 | 11,534 | 9,464 |
| 1961 | 46,153 | 32,978 | 13,175 | 1947 | 19,343 | 9,842 | 9,501 |
| 1960 | 44,946 | 31,675 | 13,271 | 1946 | 18,705 | 9,858 | 8,847 |
| 1959 | 40,735 | 29,001 | 11,733 | 1945 | 19,034 | 10,264 | 8,770 |
| 1958 | 38,569 | 27,041 | 11,528 | 1944 | 18,261 | 7,823 | 10,438 |
| 1957 | 39,030 | 26,728 | 12,302 | 1943. | 6,630 | 686 | 5,944 |

Y 360, corporation income taxes. Includes excess profits tax, 1917 and 1934-1946; unjust enrichment tax, 1937-1946; and undistributed profits tax, 1937-1939.

The corporation income tax law, effective March 1, 1913, was preceded by a corporate excise tax enacted in 1909, under which collections were as shown in table V (see Treasury Department, Annual Report of the Secretary of the Treasury, 1929, p. 420).
For 1914, 1915, and 1918-1924, the Treasury reports do not separate corporate income tax from individual income tax collections.
Collections shown for 1952-1970 include taxes on business income of exempt corporations. Also included is the income tax on the

Alaska Railroad, which was repealed for taxable years after June 30, 1952.

Table V. Collections Under the Corporate Excise Tax Act of 1909: 1910 to 1914
[In thousands of dollars. For years ending June 30]

| Year | Amount | Year | Amount |
| :---: | :---: | :---: | :---: |
| 1914 | 10,671 | 1911 | 33,512 |
| 1913 | 35,006 | 1910. | 20,960 |

Y 361, employment taxes. Includes the employer, employee, and self-employed taxes for the Federal old-age, survivors, and disability insurance system; the Federal unemployment insurance tax on employers; and the railroad retirement tax on employers and employees. Collections are received in combination with individual income taxes and the distribution by type of tax is based on estimates, as noted above in text for series Y 359.

Omitted from this series are railroad unemployment insurance contributions, collected by the Railroad Retirement Board under the Railroad Unemployment Insurance Act of 1938, as amended (45 U.S.C. 360). Although based on payrolls, this levy is not considered an internal revenue tax.
State unemployment insurance taxes also are not internal revenue collections, although the proceeds are deposited in the unemployment trust fund in the Federal Treasury.

Y 362, estate and gift taxes. Comprises, for 1863-1871 and 18991907, taxes on legacies, successions, and inheritances. The estate and gift taxes are shown separately for 1917 and later in the Treasury reports cited above. The figures for 1917-1924 and 1927-1932, inclusive, are for estate tax only. As indicated below for series Y 440-449, estate tax rate increases under the Revenue Act of June 2, 1924, were repealed retroactively February 26, 1926. Gift tax rates levied in 1924 were also reduced retroactively by the act of 1926. Estate and gift tax collections reported for 1925 and 1926 may include amounts collected at the higher rates and subsequently refunded; the refunds were reported as expenditures rather than as deductions from revenue. (See Bureau of Internal Revenue, Statistics of Income, 1946, part 1, pp. 430-431; Annual Report of the Secretary of the Treasury, 1926, pp. 291 and 350 ; 1927, pp. 965-966.)

Y 363-371 and Y 373, excise taxes. Series Y 363, excise taxes total, and series Y 366, manufacturers' excise tax subtotal, are shown for years in which these totals appear in the Treasury annual reports cited above. Taxes of these types were collected also in other years.
For the years for which they are shown, these totals include various taxes not specified in the table. The "manufacturers' excise taxes" include special taxes relating to manufacture and sale. For 18631868 , the manufacturers' excise subtotal includes a tax on raw cotton. For 1916-1970, the series includes taxes on sales under the act of October 22, 1914; manufacturers', consumers', and dealers' excise taxes under war revenue and subsequent acts; and for 1932 and later, manufacturers' excises under the act of 1932, as amended. Excise taxes on soft drinks are in the total for series Y 363 but not in series Y 366.
Y 364, alcohol. Comprises taxes on distilled spirits, beer, wines, and other products and includes occupational taxes. Includes amounts collected by the customs service on imports of distilled spirits and beer. Beginning in 1954, the reported amounts include taxes collected in Puerto Rico on alcohol products of Puerto Rican manufacture coming into the United States.

Y 365, tobacco. Comprises taxes on cigarettes, cigars, and other tobacco products. Beginning in 1954, the reported amounts include taxes collected in Puerto Rico on Puerto Rican tobacco products coming into the United States.

Y 367, automobiles and accessories. Includes tax collected for "passenger automobiles and motorcycles," "automobile trucks and
buses," and "parts and accessories for automobiles." Tax on motorcycles repealed effective September 1, 1955; tax on parts and accessories for automobiles (except truck parts) repealed effective January 1, 1966.

Y 370, admissions. Comprises "general admissions" and "cabarets," as shown separately in the Annual Report of the Secretary of the Treasury, 1970, for 1936-1970. Tax repealed effective December 31, 1965.
Y 371, telephone, telegraph, radio, and cable facilities. Includes in all years the taxes on "telephone, telegraph, radio, and cable facilities," and also, for 1942 and later, the tax on "local telephone services." General and toll telephone and typewriter service reduced to 3 percent effective January 1, 1966; retroactively restored to 10 percent rate on June 28, 1968. Private communications service, telegraph service, and wire equipment service repealed effective January 1, 1966.
Y 372, capital stock tax. This tax was not levied for years ending in the period July 1, 1926, through June 30, 1932, and for years ending after June 30, 1945. Collections after the fiscal year 1950 are included in excises, series Y 363.

## Y 374-380. Fiduciary income tax returns, 1937-1970.

Source: U.S. Internal Revenue Service, 1937-1965, Statistics of Income, Fiduciary Income Tax Returns; 1970, unpublished data.
These series were tabulated from returns (Form 1041) before official audit. All returns were used for 1937-1939, but only taxable returns were used for 1940-1951. Data for years after 1951 are based on a sample of returns filed. Prior to 1937, data for fiduciary income tax returns were shown combined with individual income tax returns.
Fiduciary returns show annual income from estates in process of settlement or any other trust for which the fiduciary acts as administrator. Only certain small trusts are excused from filing. For the period covered, returns were required if income equaled or exceeded the amounts specified for the following years:

Income of an estate-for 1937-1939, gross income of $\$ 5,000$ or net income taxable to the fiduciary of $\$ 1,000 ; 1940$, gross income of $\$ 800$; 1941, gross income of $\$ 750$; 1942-1947, gross income of $\$ 500 ; 1948-1970$, gross income of $\$ 600$.
Income of a trust-for 1937, gross income of $\$ 5,000$ or net income taxable to the fiduciary of $\$ 1,000 ; 1938$ and 1939 , gross income of $\$ 5,000$ or net income of $\$ 100 ; 1940$, gross income of $\$ 800$ or net income of $\$ 100 ; 1941$, gross income of $\$ 750$ or net income of $\$ 100$; 1942-1947, gross income of $\$ 500$ or net income of $\$ 100 ; 1948-1953$, gross income of $\$ 600$ or net income of $\$ 100 ; 1954-1970$, gross income of $\$ 600$ or any taxable income of the fiduciary.

For any tax year, a return was required if any beneficiary of the estate or trust was a nonresident alien.

Total income (series Y 375) is gross income reported in accordance with the law for each tax year. For 1937-1952, this is after business and rental expenses and allowable loss from sales of capital assets and other property, and it includes capital gains as required under the various acts. For 1954 and later years, it includes gross profit from business, gross rents, and the entire capital gain without adjustment.

Net income or taxable income (series Y 376) as shown for 1954 and later years is less inclusive than the amounts shown for earlier years. For 1937-1952, this series represents total income less allowable nonbusiness deductions and the amount distributable to beneficiaries. For these years, it is not the amount taxed, since the exemption allowed to trusts and estates has not been deducted from the net income taxable to the fiduciary. For 1954 and later years, the series shows income taxable to the fiduciary. This is total income after deduction of the exemption as well as all business and rental expenses, the authorized nonbusiness deductions, distributions to beneficiaries, and the fiduciary's share of dividend exclusions and of long-term capital gain.

Y 381-392. Corporation income tax returns, 1909-1970.
Source: U.S. Internal Revenue Service (formerly Bureau of I ternal Revenue), 1909-1915, Annual Report of the Commissioner of Internal Revenue, various issues; 1916-1970, Statistics of Income, Corporation Income Tax Returns, annual issues.

Income tax returns are required annually of all corporations except those specifically exempt, such as fraternal, civic, and charitable organizations not operating for profit.
Data for 1909-1915 are from returns received during the fiscal year beginning July 1 of the year specified. The data for 1915 include information from approximately 32,000 returns received during the preceding fiscal year.
Data for 1916-1970 are for returns with accounting periods that ended between July 1 of the year specified and June 30 of the following year (for example, figures for 1916 are for accounting periods ending Juiy 1, 1916, to June 30, 1917). A large proportion of the corporations' accounting periods coincide with the calendar year, and the calendar year is therefore used to identify the "income year." For the "income year" 1967, for example, 44.6 percent of the returns were for accounting periods that ended in December 1967; 22.5 percent for periods that ended during July-November 1967; 32.9 percent for periods that ended in the first half of 1968.
Data are based on returns as filed, prior to audit adjustments, carrybacks, renegotiation of war contracts, or other changes made after the returns were filed. For 1951-1970, data are based on a probability sample described in the annual Statistics of Income. Only the most important changes in law affecting historical comparability of the data can be noted here; others are specified in the annual Statistics of Income--for example, the varying provisions regarding life insurance company taxation.
Because of consolidated returns for affliated corporations, the number of returns (series Y 381, Y 382, Y 386, and Y 392) is not the same as the number of corporations.
Total receipts of the corporations (series Y 383 and Y 387) include gross sales and receipts from operations, interest less amortizable bond premium, rents, royalties, net gain from capital assets (as defined by law) and other property, dividends, and other taxable income-all before "total deductions." These series also include nontaxable dividends from domestic corporations for 1918-1935 and nontaxable interest, but exclude all other nontaxable income. The data for 1916-1922 represent gross income. This was smaller than the total receipts by the amounts of wholly tax-exempt interest received on certain government obligations and, for 1918-1921, of nontaxable dividends.

Total deductions include the cost of goods sold and (beginning in 1932) the cost of operations, as well as other negative amounts reported under sources of income.
Net income (less deficit) (series Y 384 and Y 388) is gross taxable income less allowable current-year deductions, except statutory deductions. This category excludes tax-exempt interest on government obligations and, for 1918-1935, dividends from domestic corporations; these are included in total receipts. Beginning in 1936, contributions or gifts were deductible in determining net income. A deduction for amortization of emergency facilities was first allowable in 1940; the deduction was later extended to grain facilities and other items. Beginning with 1963, net income (less deficit) includes constructive taxable income from related foreign corporations.
Income tax (series Y 389), as shown for 1909-1915, represents tax collections. For 1909-1912, these amounts correspond to the corporate excise tax collections noted for the fiscal years 1910-1913 in the text for series Y 360, above. For the income year 1913, the amount represents income tax and excise tax. Beginning with 1916, "income tax" is the tax liability on the returns, but before deduction of credit for taxes paid to foreign countries or U.S. possessions. For 1936-1938, the amounts include surtax on undistributed profits, as well as normal tax. For 1940 and 1941, the series includes the income defense tax; for 1941-1970, normal tax and surtax; for 1942 1970, alternative tax; for 1963-1970, tax from recomputing prior year
investment credit; for 1967-1970, the surcharge; for 1969-1970, the additional tax for tax preferences.

Excess profits tax (series Y 390) for 1917-1922 comprises war profits tax and excess profits tax, and for 1933-1945, a declared-value excess profits tax effective for tax years that ended before July 1, 1946. Data for 1940 include the declared-value excess profits defense tax, and for 1940-1946, the excess profits tax under the Second Revenue Act of 1940. Amounts for 1942-1944 are for tax liability on the excess profits tax returns less a credit for debt retirement and the net postwar refund. Deferments under section 710 (a)(5) of the 1939 Internal Revenue Code (relating to abnormalities under section 722) are reflected in the data for 1942 but not for 1943-1946. Amounts for 1943-1946 are after adjustments under various other relief provisions. The data for 1950-1954 are for the excess profits tax effective with respect to tax years from July 1, 1950, to December 31, 1953. For all years, the tax shown is before credit for foreign taxes paid.

Dividends paid (series Y 385 and Y 391) exclude liquidating dividends. They include all other dividends. In including dividends paid in the corporation's own stock, this series differs from similar series published elsewhere (e.g., U.S. Bureau of the Census, Statistical Abstract of the United States, 1973, table 640). For selected years, the amounts paid in stock, as included in the historical table, are as shown in table VI.

Inactive corporation returns (series Y 392) are those which show no items of income or deductions.

## Y 393-411. Individual income tax returns, 1913-1970.

Source: U.S. Internal Revenue Service, Statistics of Income, Individual Income Tax Returns, annual issues.

The data represent returns of residents and citizens, including those with addresses outside Alaska, Hawaii, and conterminous United States. Detailed tabulations for each year, 1961-1970, with data by levels of gross income and by States, appear in Statistics of Income, 1970, Individual Income Tax Returns, 1970, pp. 307-322.

As noted above in the text for internal revenue collections (series Y 359), the individual income tax has been a continuing element of the revenue system since 1913, but was included in Federal revenue legislation in two earlier periods.

During the Civil War decade, this tax was included in the first revenue act of the war, in 1861, at a flat rate of 3 percent on incomes above $\$ 800$. Before the initial rate took effect, it was superseded in 1862 by rates of 3 percent on up to $\$ 10,000,5$ percent above that amount of net income, and an individual exemption of $\$ 600$. Rates were raised further in 1864. The highest rates, levied for a single year, were 10 percent on net income of $\$ 600$ to $\$ 5,000,12.5$ percent on $\$ 5,000$ to $\$ 10,000$, and 15 percent above $\$ 15,000$. In 1867 , the rate became a flat 5 percent on income of more than $\$ 1,000$; for 1870 and 1871, the rate was 2.5 percent and the exemption $\$ 2,000$. The law expired at the end of 1871.

An individual income tax law adopted in 1894 was patterned generally after the law of 1867 . It provided a 2 percent tax rate on individual and corporate net income, with a $\$ 4,000$ exemption for individuals. Personal property received by gift or inheritance was to be included in net income. The act was declared unconstitutional in 1895 in a Supreme Court decision (Pollock v. Farmers' Loan and Trust Co., 157 U.S. 429, 158 U.S. 601). The personal income tax was not again levied until after adoption in 1913 of the Sixteenth Amendment to the Constitution. For data showing individual income tax collections covering the period 1863-1895, see text for series Y 359.

The data for 1913-1970 relate to returns filed under the income tax laws of 1913 and subsequent years. A return is required of every citizen or resident with gross or net income above a specified minimum. The requirements for filing have changed from time to time and are summarized below.

Table VII. Requirements for Filing Individual Income Tax Returns: 1913 to 1970

| Year | Return required if net or gross income equaled or exceeded amount specified |  |
| :---: | :---: | :---: |
|  | Single, or married and not living with spouse | Married couple, joint return ${ }^{2}$ |
| 1970 | Gross, \$1,700 | Gross, \$2,300 ${ }^{3}$ |
| 1954-1969 |  | Gross, $\$ 600$ each spouse ${ }^{4}$ |
| 1948-1953 | Gross, \$600 | Gross, \$600 each spouse |
| 1944-1947 | Gross, $\$ 500$ | Gross, $\$ 500$ each spouse |
| 1941 | Gross, $\$ 750$ | Gross, ${ }_{\text {Gross, }} \$ 1,500$ |
|  | Gross, $\$ 800$ | Gross, $\$ 2,000$ |
| 1932-1939 | Net, \$1,000 or gross, \$5,000 | Net, \$2,500 or gross, \$5,000 |
| 1925-1931 | Net, $\$ 1,500$ or gross, $\$ 5,000$ | Net, \$3,500 or gross, \$5,000 |
| 1924 | Net, \$1,000 or gross, \$5,000 | Net, \$2,500 or gross, \$5,000 |
| 1921-1923 | Net, \$1,000 or gross, \$5,000 | Net, \$2,000 or gross, $\$ 5,000$ |
| 1917-1920 | Net, $\$ 1,000$ Net, $\$ 3,000$ | Net, $\$ 2,000$ |
| 1913-1916 | Net, \$3,000 | Net, \$3,000 |
| ${ }^{1}$ Through 1943, amount shown is combined net or combined gross income. <br> ${ }^{2}$ Gross income of $\$ 2,300$ if age 65 or over. <br> ${ }^{3}$ Gross income of $\$ 2,900$, if one spouse age 65 or over; $\$ 3,500$ if both age 65 or over. <br> ${ }^{4}$ Gross income of $\$ 1,200$ for each person age 65 or older. <br> ${ }^{5}$ Also, for 1943, required to file if liable for 1942 tax, regardless of 1943 gross income. <br> ${ }^{6}$ Also, for 1943 , required to file if gross income of either spouse exceeded $\$ 624$ or if |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  |  |

A joint return could be filed by husband and wife if income of both was included or if one spouse had no income.
For 1951-1970, a return was required of any individual whose net earnings for self-employment tax were $\$ 400$ or more, regardless of the gross income requirement for filing.
In addition, under the current tax payment system instituted in 1943, returns were filed to claim refunds of taxes overpaid, even though the individual was not otherwise required to file.

Fiduciary income of an estate or trust for 1913-1936 was reported on an individual return form when there remained in the hands of the fiduciary net income which was taxable to him and not distributed to beneficiaries. Such a return for net income taxable to the fiduciary was required under the same conditions as those stated above for single persons during this period.
Data for 1913-1915 were derived from annual reports of the Commissioner of Internal Revenue, net income being determined on the basis of number of returns filed and the average net income in each class. Subsequent data were taken from returns, unaudited except to insure proper execution. Data for 1916 were tabulated from each return, but for later years were compiled by sampling techniques to represent the universe of returns, Form 1040 and 1040A (replaced by W-2 for 1944-1947). Tabulated data cover individual and fiduciary returns with net income of $\$ 3,000$ or more, 1913-1916; returns with net income of $\$ 1,000$ or more, 1917-1920; returns with net income, 1921-1927; all individual and fiduciary returns with net income, but only individual returns with no net income, 1928-1936; individual returns with net income or no net income, 1937-1943; and individual returns with adjusted gross income or no adjusted
gross income, 1944-1970, except that returns with no information were excluded for 1953-1956.

In the great majority of cases, the returns are for the calendar year, although some returns are for accounting periods ended during the calendar year. Also, some returns cover income attributable to several tax years. Prior to 1957, the tabulations of adjusted gross income (series Y 397) included only income attributed to the current tax year. For 1957 and later years adjusted gross income includes the whole amount received by the taxpayer within his tax year even if it was reported as income earned over a period of time that included prior tax years.
Adjusted gross income for 1944-1970 is total income reported for tax purposes less deductions for certain expenses generally related to the acquisition of income. These deductions include business and rental expenses, certain travel and transportation expenses of employees, depreciation allowed life tenants of property held in trust, allowable loss from the sale of capital assets and other property, adjustments for long-term capital gain, net operating loss deductions, and for 1954-1970, excludable sick pay, the limited exclusion of dividends, and expenses of salesmen. For 1964-1970, deductions of expenses of employees moving to a new job and deductions of pension plan contributions of self-employed persons were allowed.

Under the Internal Revenue Code of 1954, taxable income (series Y 398) for 1954-1970 is the base on which the tax is computed. It consists of adjusted gross income less nonbusiness deductions, standard or itemized. Itemized deductions are for taxes, contributions, interest, and other specified purposes, and also include all personal exemptions. The figures for taxable income embrace all returns, including those showing the so-called "optional tax," i.e., a tax determined by reference to a simplified tax table involving standard deductions rather than itemized nonbusiness deductions.
During 1948-1969, personal exemptions were $\$ 600$ a year for each person-the taxpayer, his spouse, and dependents. A taxpayer aged 65 or older was allowed an additional $\$ 600$ exemption for himself and, if a joint return was filed, for his wife if she was 65 or older. Likewise, an additional $\$ 600$ exemption was allowed a blind taxpayer or a blind spouse. For 1970 the exemption amount was raised to $\$ 625$.

Total income (series Y 405 and Y 409) for 1913-1943 is the gross income reported for income tax purposes under the act in effect for the income year. It is the total income after deduction of business and rental expenses and allowable loss on sales of capital assets and other property. Capital gain is included to the extent provided under successive acts.

Net income (series Y 406) for 1913-1943 is total income less authorized deductions. However, in the Statistics of Income for 19221931 the allowable prior-year loss was not deducted, and for 1924-1933 a capital loss that gave rise to a tax credit was not deducted. In the case of fiduciary net income, distribution to the beneficiary was an authorized deduction for 1913-1936. Net income in all years is measured before deduction of personal exemptions; it is not the tax base. The series is not available after 1943.

The small amounts of tax reported for 1938-1941 for returns with no net income (series Y 411) are an alternative tax on a small number of returns which showed a long-term capital loss and, for 1940 and 1941, a defense tax. For 1943, a victory tax was due on 17,438 returns with no net income.

Y 412-439. Individual income tax liability and effective rates, for selected income groups, 1913-1970.
Source: U.S. Department of the Treasury, unpublished data.
Maximum earned net income is assumed where it affects the amount of tax liability. In the case of the married couple (four exemptions), the computations assume prior to 1948 that only one spouse had income. Beginning with the income year 1948, all married couples have been permitted to combine their incomes in a joint return and to split the taxable income equally for purposes of the tax computation; a joint return on the split-income basis is therefore assumed for the married couple for the income years 1948-1970.

For the same years, persons of age 65 or older and blind persons were allowed additional exemptions; consequently, the illustrative data for 1948-1970 apply equally to any married couple claiming 4 exemptions, whether the additional exemptions were for dependents, age, or blindness.

The effective tax rate is the tax liability as a percentage of the amount of net income. The liability is the amount for income tax only, including the defense and victory taxes of 1940 and 1943; it does not include the self-employment tax for social security, applicable for 1951-1970.
Net income, as used here, is gross income (after 1943, adjusted gross income) minus nonbusiness deductions for contributions, interest, taxes, medical and dental expenses, and other allowable expenses, but before deduction of personal exemptions. Also excluded from net income (and from adjusted gross income) is tax-exempt interest on government obligations, excludable sick pay under the Revenue Act of 1954, certain expenses related to the acquisition of income, and other nontaxable income.

Statutory changes have been made from time to time in the allowable nonbusiness deductions. For example, the deduction for medical expenses was amended several times during 1944-1970. Another type of nonbusiness deduction, the amount allowed for contributions, was limited to 20 percent of adjusted gross income prior to 1954; for 1954-1970, taxpayers were allowed to deduct more than 20 percent to the extent that the excess (limited to 10 percent of adjusted gross income through 1969; 30 percent in 1970) was for contributions to hospitals, churches, or educational institutions.

In consequence of these and other changes, a given amount of net income could be associated with somewhat different amounts of gross income in different years. Even in any one year, a given amount of net income could be associated with different amounts of gross income for different taxpayers in accordance with their varying allowable deductions.

Beginning with the income year 1941, taxpayers with gross income of not more than $\$ 3,000$ from specified sources were allowed to use a simplified return, Form 1040A, with the tax determined by a table that allowed a standard percentage of earned income credit and deductions from income. Taxpayers who did not use the short form were required to itemize deductions. In either case, the 1943 victory tax had to be computed separately. Legislation simplifying the filing of tax returns made available (beginning in 1944) the option of a standard deduction of 10 percent of adjusted gross income, limited to $\$ 500$ for 1944-1947. For 1948-1970, the limit was raised to $\$ 1,000$ for single persons and for married persons filing joint returns. In general, this implies that, for 1944-1947, net incomes of \$4,500 or less and, for 1948-1970, net incomes of $\$ 9,000$ or less, as shown in the table, would represent adjusted gross incomes at least ten-ninths as large. (That is, $\$ 800$ net represents at least $\$ 889$ of adjusted gross income; $\$ 1,000$ net, at least $\$ 1,111$ gross; $\$ 4,500$ net, at least $\$ 5,000$ gross; etc.)

For some types of analysis, effective rates based on gross rather then net income might be more pertinent. Such rates can be computed by making uniform assumptions about the deductions associated with the several specified levels of net income. For example, if it is assumed that the standard deductions made up the whole difference between adjusted gross and net income in cases in which the standard deduction was available, the effective percentage rate of tax on adjusted gross income in these cases would be nine-tenths of the effective rates shown in series Y 412-439. For another type of computation of effective tax rates, see Internal Revenue Service, Statistics of Income, 1970, Individual Income Tax Returns, p. 149.

The history since 1913 of the personal exemptions (including credits for dependents) and of the range of tax rates applicable to taxable individual incomes is summarized below in table VIII, from the following publications: 1913-1950, Treasury Department, Annual Report of the Secretary of the Treasury, 1940, pp. 466-467, and 1950, p. 251; 1951-1957, Joint Economic Committee, The Federal Revenue

System: Facts and Problems, 1959, 86th Congress, 1st session, p. 189; and 1958-1970, unpublished Treasury Department data.

${ }^{1}$ Includes 2.5 percent surcharge, but lowest bracket unaffected; maximum effective rate on earned income is 60 percent.
${ }^{2}$ Additional exemptions of $\$ 600$ ( $\$ 625$ in 1970) are allowed to taxpayers and their spouses on account of blindness and /or age 65 or older.
${ }^{3}$ Includes 10 percent surcharge, but lowest bracket unaffected.
${ }^{5}$ Subject to maximum effective rate limitation: 90 percent for $1944-45,85.5$ percent for $1946-47,77$ percent for $1948-49,80$ percent for $1950,87.2$ percent for 1951,88 percent for 1952-53, and 87 percent for 1954-59.

- Exclusive of victory tax.
${ }^{7}$ Before earned income credit allowed as a deduction equal to 10 percent of earned net income.
8 After earned income credit equal to 25 percent of tax on earned income.
${ }^{9}$ If net income exceeds $\$ 5,000$, married person's exemption is $\$ 2,000$.

## Y 440-449. Federal estate tax returns, 1916-1970.

Source: U.S. Internal Revenue Service, Statisiics of Income, Estate Tax Returns.
These data are from returns filed, before audit. Data for returns filed in 1966 and 1970 are based on a sample.
The Federal estate tax is a levy upon the transfer of property by a decedent. It differs from inheritance taxes, in which, generally, the tax is on the privilege of receiving property by inheritance and is levied upon the heirs.

The base of the tax is the value of the gross estate transferred, adjusted for exclusions, deductions, and exemptions. The tax is imposed at graduated rates, and certain credits are allowed against the tax so computed.
The estate tax in its present form became a permanent part of the Federal tax system in 1916, but four times earlier death taxes had been imposed by the Federal Government. During 1797-1802, a stamp tax applied to succession to personal property by inheritance. The Civil War Revenue Act of 1862 included an inheritance tax which was substantially increased in 1864; this tax was repealed in 1870. The income tax act of 1894 included an inheritance tax that was abandoned when the income tax was declared unconstitutional. The Revenue Act of 1898, for financing the Spanish-American War,
included a short-lived tax applicable to all estates of over $\$ 10,000$, except those inherited by spouses.

Table IX summarizes the history of Federal estate tax rates and exemptions for 1916-1970. An estate tax return was required if the value of the gross estate at the date of death exceeded the allowable specific exemption as shown in the table and footnote 1.

The estate of an individual who died in the period June 6, 1932, through August 16, 1954, was subject to two estate taxes-basic and additional. Basic tax was at the rates provided in the 1926 act; additional tax was the excess of a tentative tax at rates provided by the act in force at date of death, over the basic tax. Under the 1954 Code, these two taxes were combined and a single tax rate applied to the net taxable estate.

Table IX. Estate Tax Rates, Specific Exemption, and Insurance Exclusion: 1916 to 1970

| Date of death | Tax rates, range (percent) | Minimum rate applies to first- | Maximum rate applies above- | Specific exemption | Insurance exclusion |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Oct. 22, 1942-1970.- | 3.0-77 | \$5,000 | \$10,000,000 | \$60,000 |  |

| Oct. 4, 1917-Feb. 24, 1919 | $2.0-25$ | 50,000 | 10,000,000 | 50,000 |  |
| Mar. 3-Oct, 3, 1917-2- | 1.5-15 | 50,000 | 5,000,000 | 50,000 |  |
| Sept. 9, 1916-Mar. 2, 1917. | 1.0-10 | 50,000 | 5,000,000 | 50,000 |  |

${ }^{2}$ For estate of resident citizen or alien. The same specific exemption was granted for estates of nonresident citizens dying after May 10, 1934. Exemptions were not granted to estates of nonresident aliens until Oct. 22, 1942, when a $\$ 2,000$ exemption became available.
2 For deaths from June 26, 1940, to Sept. 20, 1941, a defense tax was added equal to 10 percent of the net estate tax (computed at the rates of 2 to 70 percent) after deduction of credits for gift taxes and State death taxes.
${ }^{3}$ Higher rates, ranging from 1 percent to a top-bracket rate of 40 percent on the excess over $\$ 10,000,000$ were provided in the Revenue Act of June 2, 1924, but the rates of the 1921 act were restored retroactively Feb. 26, 1926. Refunds were author ized for overpayments made at the bigher rates. The net tax (series Y 445 and $Y 449$ ) was computed at the lower rates (Statistics of Income, 1925, pp. 70-71, 82).
Source: Adapted from Internal Revenue Service, Statislics of Income, various issues; U.S. Department of the Treasury, Annual Report of the Secretary of the Treasury, 1940 pp. 478-479, and 1950, p. 258.

A marital deduction for bequests to the surviving spouse applied to the estates of persons who died after 1947. The deduction is limited to the smaller of either one-half the value of the adjusted gross estate or the value of the qualifying property interests which pass to the surviving spouse. The impact of this provision is reflected in the statistics.

Gross estate (series Y 442 and Y 447) includes all property possessed to the extent of the decedent's interest therein at death, including certain transfers made during life without full consideration, joint estates, tenancies by the entirety, dower and courtesy of surviving spouse, and life insurance on the life of the decedent if the estate was administered under the 1942 or subsequent acts. The value of the gross estate may be either the value at date of death or as of the date one year after death, whichever the executor elected in case death occurred on or after August 31, 1935.

Net taxable estate (series Y 443 and Y 448) is gross estate less the deductions and specific exemptions allowed under the act in effect at date of death. These have varied somewhat among the different acts.

## Y 450-456. Federal gift tax returns, 1924-1966.

Source: U.S. Internal Revenue Service, Statistics of Income, Gift Tax Returns.

These data are from returns filed, before audit. Data for returns filed in 1961, 1963, and 1966 are based on a sample. Data have not been tabulated in years for which no figures are shown.

The Federal gift tax, like the estate tax, is a levy upon transfers of property by gift. The tax is a liability of the person making the gift and is based upon the value of the transferred property.

The gift tax was first levied for 1924 and 1925. For these years, a return was required for gifts of property located in the United States, made by individuals, corporations, associations, partnerships, trusts, or estates, if total gifts exceeded the sum of authorized deductions for exemption, charitable gifts, and previously taxed property, and if the aggregate exceeded $\$ 500$ to any one donee.

The present gift tax was introduced in 1932 in connection with substantial revisions in the estate tax. The rates were three-fourths of those in the estate tax, and this relationship was maintained through subsequent revisions (subject, however, to differences in the effective dates of rate and exemption changes). A return was required during 1932-1970 if aggregate gifts in the year to any donee exceeded the allowable annual exclusion per donee and for gifts of future interests regardless of value. Tax rates, specific exemptions, and annual exclusions are summarized in table X.

Table X. Gift Tax Rates, Exemptions, and Exclusions: 1924 to 1970

| Calendar year of gift | Tax rates, range (percent) | Minimum rate applies to first- | Maximum rate applies above- | Specific exemption ${ }^{1}$ | Annual exclusian per donee |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1943-1970 | 2.25-57.75 | \$5,000 | \$10,000,000 | \$30,000 | \$3,000 |
| 1942 | 2.25-57.75 | 5,000 | 10,000,000 | 40,000 | 4,000 |
| 1939-1941 | $21.5-52.5$ | 10,000 | 50,000,000 | 40,000 | 4,000 |
| 1936-1938 | 1.5-52.5 | 10,000 | 50,000,000 | 40,000 | 5,000 |

| 1932 ${ }^{\text {3-1 }} 1934$ | 75-33.5 | 10,000 | 10,000,000 | 50,000 | 5,000 |
| 1924-1925. | 1-25 | 50,000 | 10,000,000 | 50,000 | 500 |

${ }^{1}$ During 1924-1925, allowed in each calendar year; in later years, allowed only once.
once.
2
From June
26, 1940 , through 1941, subject to additional defense tax equal to 10 percent of basic tax liability.

In effect for gifts June 7, 1932, and later.
In effect June 24, 1924.
Source: Adapted from Internal Revenue Service, Statistics of Income, various issues; U.S. Department of the Treasury, Annual Report of the Secretary of the Treasury, 1940, pp. 478-579, and 1950, p. 258.

Since 1932 the tax has applied to individuals only (citizens, residents, or nonresident aliens) for transfer of property situated in the United States.

Gift tax rates are progressive in application; that is, current graduated rates are applied to (a) the aggregate net taxable gifts made after June 6, 1932, and to (b) the aggregate net gifts exclusive of those made in the current year-the excess of tax in (a) over (b) being the current tax liability.

As indicated in table $X$, the donor is allowed to exclude gifts of less than a specified amount to each recipient in each year. This annual exclusion was $\$ 3,000$ for each donee for the years 1943-1970. In addition, a specific exemption ( $\$ 30,000$ during 1943-1970) is allowed each citizen or resident and may be taken, at his option, entirely in a single year or spread over a number of years. After April 2, 1948, a marital deduction of one-half of the value of gifts made between a husband and wife was allowed citizens and residents.

Total gifts (series Y 452 and Y 456) is the value of property (real property or tangible or intangible personal property) transferred without full consideration in money or money's worth, whether transferred in trust or otherwise, whether direct or indirect, or of future interests. Generally, gifts of less than the allowable annual exclusion for each donee are not reported, except that gifts of future interests must be included regardless of value (and, for 1989-1942, gifts in trust).

Net taxable gift (series Y 453) is the tax base. It is the value of total gifts minus the exclusion for each donee, deductions, and specific exemptions.

## Y 457-465. Outlays of the Federal Government, 1789-1970.

Source: All series except Y 463, U.S. Department of the Treasury, Statistical Appendix to Annual Report of the Secretary of the Treasury, 1970, pp. 8-16. Series Y 463, 1789-1946, Department of the Treasury, Annual Report, 1946, pp. 422-423; 1947-1970, U.S. Office of Management and Budget (formerly Bureau of the Budget), Budget of the United States Government, annual issues, 1949-1970.

Data for 1954-1970 are unified budget outlays. For earlier years data are for the administrative budget, so they exclude expenditures from trust funds. Series Y 466-471 show consolidated cash data for the years 1940 through 1953. The consolidated cash data are more comparable to the unified budget data than are the administrative budget data, but data on cash payments by agency are not available.

In the case of public enterprise funds (including the postal service) and various intra-governmental funds, expenditures included in the total are on a net basis-that is, their collections are deducted from gross expenditures and the results are the net expenditures included in Federal Government expenditure accounts. In the case of the postal service, the net postal expenditure is included in the total and "other" (series Y 457 and Y 462) expenditures in the years in which there was a postal deficit. For a historical series showing gross postal expenditures in relation to postal receipts, see references in text for series Y 352-357.

Expenditures for 1789-1915 are based on warrants issued; for 1916-1952, on the Daily Statement of the United States Treasury; for 1953-1970, on the Treasury's Monthly Statement of Receipts and Expenditures of the United States Government.

In the Monthly Statement, expenditures are reported on the basis of checks issued by disbursing officers, except for interest on the public debt and payments made in cash. Where payment is made by the issuance of bonds or by an increase in their redemption value, instead of by the issuance of checks, such an issuance or increase is an expenditure. Interest on the public debt is reported on an accrual basis. For years prior to those reported in the Monthly Statement, interest on the public debt is reported on the same basis as other expenditures.

The figures for 1916-1952 were compiled from daily reports received by the Treasurer of the United States from Government depositaries and Treasury offices holding Government funds. On this basis, the expenditures include payments on checks outstanding at the beginning of the fiscal year and do not include checks unpaid at the end of the year. Beginning with the fiscal year 1947, expenditures of several departments and establishments were reported on the basis of checks issued, so that the detail in the daily statement was partly based on checks issued, partly on checks paid. The change to the monthly statement basis eliminated the necessity for showing an item of "adjustment to daily Treasury statement basis" in tabulations presenting components of the expenditure total.

Y 466-471. Outlays of the Federal Government, by major function, 1900-1939.
Source: U.S. Bureau of the Budget, unpublished data.
Basic data are from the following:
1900-1914. Adapted from Bureau of the Budget compilation for 1900-1948 in U.S. Congress, Congressional Record, 80 th Congress, 2 d session, vol. 94, pt. 2, March 11, 1948, pp. 2576-2577. Series Y 469, veterans services and benefits, supplied from the Treasury compilation in series Y 463 (see below). Tax refunds of $\$ 10$ million a year deducted from 1913 and 1914 to conform to the 1959 Federal Budget Mid-Year Review (September 1958), p. 42, where budget receipt and expenditure totals are shown for each year, 1900-1939, with refunds excluded starting in 1913.

1915-1920. Congressional Record, cited above, but with tax refunds deducted.

1921-1938. Unpublished Bureau of the Budget table for 19201939, September 17, 1958; but with series Y 468, International affairs and finance, supplied from Congressional Record, cited above.
1939. Unpublished Bureau of the Budget table for 1939-1950, February 1959.

As Federal Government operations expanded in volume and variety, the limited classification of expenditures exemplified in series Y 457465 (even when supplemented with additional items and subdivided to give more specific categories) was inadequate to delineate the scope of Government programs and to focus attention on significant shifts in the purpose of expenditures. The text for series Y 472-487 explains the development to and definitions of the current Government expenditures.

Series Y 469, veterans services and benefits, may be slightly understated for 1900-1914, as it comprises only the payments for veterans compensation and pensions, the same as series $Y 463$. Any such understatement in series $Y 469$ apparently would not exceed $\$ 12$ million a year and is balanced by an equal overstatement in the residual series, Y 471, for "All other."

Refunds are excluded from series Y 466-471 since 1912. Consequently, total expenditures, series $Y$ 466, for 1913-1930 deviate from those shown in series Y 336 and Y 457 by the amount of refunds.

Y 472-487. Outlays of the Federal Government, by major function, 1940-1970.

Source: U.S. Office of Management and Budget, Federal Government Finances (mimeographed tables), October 31, 1972.

A systematic classification of expenditures by major functional categories and more specific subfunctions was introduced in the budget for the fiscal year 1948. Although each succeeding annual budget modified some of the categories or shifted particular items from one classification to another, continuity of the series was maintained by adjusting the data for prior years so that the data for each function is as consistent as feasible. Details concerning the composition of the classifications shown here (including the subfunctional groupings) may be found in the 1973 budget document.
In 1967 the President's Commission on Budget Concepts recommended substantial changes in the budget concept. These changes were first reflected in the 1969 Budget but the data were carried back on a comparable basis through 1954. While historical data on the current budget basis are not available prior to 1954, the consolidated cash statements are a reasonable approximation for earlier years. The principal differences between the cash and unified budget data are: (1) many proprietary receipts are included in the consolidated cash statement as income but are offsets to outlays under the unified budget, (2) the cash statement has certain timing adjustments not made in the unified budget, and (3) certain activities-such as two privately-owned but federally-chartered banking institutions-are included in the cash totals but excluded from the unified budget totals. In all cases, the functional data for the consolidated cash statement have been made as comparable as feasible; the discontinuities are concentrated in the unallocable column. For a more complete discussion see text for series Y 339-342.

For years prior to 1940, the figures in series Y 457-465 are a rough approximation of certain functional categories. The sum of expenditures for the Department of the Army and the Department of the Navy are roughly equivalent to the national defense function; interest on the public debt is roughly equivalent to the interest function, and veterans compensation and pensions (series $Y 463$ ) is roughly equivalent to veterans benefits and services (series Y 469).

## Y 488-492. Gross Federal debt outstanding, 1939-1970.

Source: U.S. Office of Management and Budget, Federal Government Finances (mimeographed tables), October 31, 1972.

Gross Federal debt is the broadest generally used measure of the Federal debt. It is composed primarily of the public debt (direct borrowing by the Treasury) but also includes agency debt (such as borrowing by the Tennessee Valley Authority or the Postal Service). About three-fourths of the gross debt is held by the public, and about
one-fourth is held by Government accounts. The Government-held debt results from the fact that the surpluses of trust funds are normally invested in public debt securities. The interest payments on this Government-held debt are made from one account within the budget to another account within the budget and do not, therefore, affect the budget deficit or surplus. Only the debt owed to the public gives rise to net budget expenditures for interest.

The Federal Reserve System is an independent, federally-chartered, central banking system. As the System is not included in the Federal budget, debt held by the System is included in "debt held by the public." Interest paid on Federal debt held by the System is not, therefore, an intrabudgetary transaction. However, since 1947 the Federal Reserve System has made annual payments to the Treasury from its surplus, which, in turn, arises primarily as a result of interest payments made by the Treasury to the Federal Reserve. In 1970, these payments amounted to $\$ 3.3$ billion, equal to the bulk of interest payments to the Federal Reserve System. Thus, interest payments to the Federal Reserve System have very little net effect on the budget deficit or surplus.

This series differs from series Y 493-504, which excludes Federal agency debt issuances. See also text for series Y 493-504.

## Y 493-504. Public debt of the Federal Government, 1791-1970.

Source: Series Y 493-497, U.S. Department of the Treasury, Statistical Appendix to Annual Report of the Secretary of the Treasury, 1970, pp. 60-61. Series Y 498-499, 1855 and 1892-1915, U.S. Bureau of Foreign and Domestic Commerce, Statistical Abstract of the United States, 1921, p. 829; 1856-1891 and 1916-1970, U.S. Department of the Treasury, Annual Report, 1891, p. XCIV, 1946, p. 546, and Statistical Appendix, 1970, pp. 220-221. Series Y 500-504, 1880-1915, U.S. Department of the Treasury, unpublished data; 1916-1970, Annual Report, 1946, p. 459, 1958, pp. 472-473, 1967, p. 506, and Statistical Appendix, 1970, p. 66.

The total public debt (series Y 493) as reported at the end of each fiscal period is essentially the formal funded debt of the Federal Government, both long-term and short-term. It includes savings bonds at current redemption value. It differs from gross Federal debt (series Y 488) in that public debt represents borrowing by the Department of the Treasury; gross Federal debt also includes borrowing by Federal agencies. (The Federal agency debt outstanding at the end of fiscal 1970 was $\$ 12.5$ billion.)

Studies by Paul B. Trescott and others have suggested that the debt totals (series Y 493) as compiled by the Treasury Department for the early years of the Republic-1791 into the early 1800's-may omit obligations incurred otherwise than by the issuance of Treasury obligations and may include some contingent liabilities that would be excluded by the definitions adopted in later years. (Trescott, unpublished memoranda; see also Paul Studenski and Herman E. Krooss, Financial History of the United States, McGraw-Hill, New York, 1952, p. 3, footnote 1.) See also text for series Y 335-338.

Although nearly all the public debt is interest-bearing, the total includes some obligations that bear no interest and matured debt on which interest has ceased. In recent years, a substantial part of the public debt has been held in the trust funds and other Treasury investment accounts. (For the ownership of Federal public debt securities at several dates for 1960-1970, see the Annual Report of the Secretary of the Treasury, 1970, p. 14, and Statistical Appendix (ibid.), p. 230.) Certain unfunded obligations of the Government are not counted in the public debt-for example, a potential obligation of the Government for unpaid employer contributions to the civil service retirement and disability fund.

The formal concept of "the public debt," as used in Federal fiscal reports, appears to have emerged following initial enactment of a statutory ceiling on the debt of the Federal Government. Such a ceiling was first provided in the Second Liberty Bond Act of 1917; prior to May 26, 1938, the limitation applied to particular segments of the debt, not to the total. The debt ceiling has been modified from time to time in subsequent legislation. For a tabular summary of
the debt limit legislation, 1917-1970, see Statistical Appendix to Annual Report of the Secretary of the Treasury, 1970, p. 108. See also Marshall A. Robinson, The National Debt Ceiling, An Experiment in Fiscal Policy, The Brookings Institute, Washington, D.C., 1959.

Despite the close relationship of "the public debt" (series Y 493) to the debt limitation, series Y 493 includes a relatively small amount of obligations not subject to statutory limitations. Robinson, cited above, points out (p. 8) that "the Federal debt is part of a larger structure of Federal Government obligations. ... The legally defined gross Federal debt . . . is the debt that falls under the debt limitation, and it is what general usage calls the national debt." For a rough estimate of some additional obligations not included in "total gross debt," see a compilation by the Comptroller General of the United States, in Investigation of the Financial Condition of the United States: Hearings Before the Senate Committee on Finance, 85th Congress, 1st session, vol. 1, June 26, 1957, pp. 81-82, 269.

Various writers have contended that the most meaningful measure of the national debt in economic terms is "debt owed to the public." "Debt held by the public," series Y 490, closely corresponds to this concept, which includes Federal agency as well as Treasury (public) debt issues.
The computed annual interest charge, series Y 498, represents the amount of interest that would be paid if each interest-bearing issue outstanding at the end of the year should remain outstanding for a year at the applicable annual rate of interest. The charge is computed for each issue by applying the appropriate annual interest rate to the amount outstanding on that date. The aggregate charge is the total of the computed amounts for all interest-bearing issues. The average annual rate is computed by dividing the computed annual interest charge for the total of outstanding issues by the corresponding principal amount. Beginning December 31, 1958, the computed average rate is based upon the rate of effective yield for issues sold at premiums or discounts. Before that date the computed average rate was based upon the coupon rates of the securities.

## Y 505-848. General note.

The concepts and terms used in these series were originally developed for the Bureau of the Census reporting on finances of State and local governments. These concepts have also been applied to Federal Government data to provide comparable comprehensive aggregates covering all levels of government.
For a full discussion of basic concepts and terminology and of the classifications of revenue and expenditure, see the source for years 1902-1967 for series $Y$ 505-566, pp. 1-12. A few of the more important items are discussed here.
General revenue and general expenditure, as used in these series, refer to all sources or purposes other than certain specifically defined utility, liquor store, and insurance trust operations.

Intergovernmental revenue and intergovernmental expenditure refer to transactions between the Federal, State, and local governments. To avoid double counting, such transactions are netted out of aggregates comprising the groups of governments concerned. Transactions with governments of other countries are not defined as intergovernmental. The value of intergovernmental aid "in kind" (for example, commodities or other property given by the Federal Government to State or local government agencies) is not included in either intergovernmental or other revenue of the receiving government; the expenditures involved in granting such aid are included in direct expenditure of the granting government.

Besides intergovernmental aid "in kind," the following types of transactions between governments have not been isolated for special treatment as intergovernmental revenue or expenditure:
a. Contributions by local governments to State-administered retirement systems that cover their employees. These are included without distinction as part of the "current operation" expenditure of the local governments, and the receipts are included with State insurance trust revenue.
b. Interest paid or received on obligations of one government held by another government.
c. Transactions in which governments deal as ordinary suppliers and customers-e.g., in purchasing property, utility services, or supplies from one another.
Direct expenditure comprises all expenditure other than intergovernmental expenditure.

Since the data utilized for each individual government represent a consolidation of amounts from its various funds, payments between funds are eliminated for census reporting. Thus, a government employer contribution to a retirement fund it administers is not counted as expenditure, nor is the receipt of this contribution by the retirement fund considered revenue; only the payment out of the fund for retirement benefits is classified in the census tabulations as a governmental expenditure (in this particular illustration, an insurance trust expenditure).

The substantial amount of interest paid by the U.S. Treasury to the Federal insurance trust funds, which have all their reserves invested in Federal securities, is excluded from Federal interest expenditure and insurance trust revenue to avoid double counting in Federal financial aggregates. However, the principle of eliminating interfund transactions is not followed in the case of interest paid by a State or local government on any of its own securities held as an investment by insurance funds it administers-mainly because of the difficulty of identifying such transactions.

Y 505-566. Federal, State, and local government finances, 1902-1970.
Source: U.S. Bureau of the Census, 1902-1967, Census of Governments, 1967, vol. 6, No. 5, Historical Statistics on Governmental Finances and Employment; 1968-1970, Governmental Finances in 1970-71.

These data are a consolidation of data for the Federal Government in series Y 567-637 and for State and local governments in series Y 652-709. The amounts in these series are net of intergovernmental transactions between the Federal, State, and local governments.

## Y 567~637. Federal Government finances, 1902-1970.

## Source: See source for series Y 505-566.

The Bureau of the Census classification of Federal fiscal data was used in annual reports on Governmental Finances for the fiscal years 1952 through 1970. Derivation of the Federal Government data for earlier years is described on pp. 8-9 of Historical Summary of Governmental Finances in the United States (Census of Governments: 1967, vol. IV, No. 3).

The classification used by the Bureau of the Census for reporting State and local government finance statistics differs from the classification used in the U.S. Budget. Accordingly, it was necessary to recast U.S. Budget data. This involved not only (1) grouping of individual Federal receipt items and "budget expenditure" amounts for various agencies and appropriation items in accordance with the functional framework used for reporting of State and local government finances, but also (2) applying certain adjustments to Federal "budget receipts" and "budget expenditures" data in order to arrive at "revenue" and "expenditure" amounts, as reported here. These adjustments took account of the following major differences between these series:
(1) The financial transactions of government enterprises are included in Federal budget figures only to the extent of their net effect (plus or minus) upon budget expenditures; Census figures include gross revenue and expenditure of government enterprises (other than loan and investment transactions).
(2) Receipts from various enterprises or market-oriented Federal activities, from interest on loans the government has made, from sales of property or products, and from certain other reimbursements from non-Federal sources, as well as receipts from charges
for quarters and subsistence furnished to employees are treated in the Federal budget as offsets against expenditures and result in reducing Federal expenditure totals of related activities. For census purposes, these amounts are counted as revenue and added back to expenditure.
(3) Federal budget receipts and expenditures now include various financial transactions of trust funds which were excluded before fiscal 1967. Such transactions are included in census reporting of Federal revenue and expenditure, except for trust funds handled on an agency basis for State and local governments (e.g., the State accounts in the unemployment compensation fund, and District of Columbia funds).
(4) Although interfund and intragovernmental transactions are netted out of Federal budget totals, such transfer amounts are included in Federal figures for various receipts and expenditure categories. Census figures exclude such transfers.
(5) Federal budget expenditures include interest accrued but not paid during the fiscal year; census data on interest are on a disbursement basis.
(6) The net excess of loan disbursements or loan repayments of Federal loan accounts is added to expenditures or to receipts in developing budget totals. Such loan transactions are excluded from census reporting of Federal data.

In the 1967 Census of Governments reports, the introductory text includes detail for 1942-1967 for the census category, "National defense and international relations," showing how related items in Federal budget reports are regrouped in the Census of Governments classifications; and for 1902-1967, showing the census treatment of items grouped in Federal budget reports under "Veterans services and benefits." Other functional categories also differ from those shown for the Federal Government in series Y 335-471.

Federal Government indebtedness and the change in debt outstanding (series Y 601-604) correspond with "public debt" as reported by the U.S. Treasury. Consequently, series Y 601 is the same as series Y 493.

## Y 638-651. Federal grants to State and local governments, 1930-1970.

Source: U.S. Social Security Administration, Social Security Bulletin, September 1971, p. 16. These series were compiled from the following Department of the Treasury sources: Annual Report of the Secretary of the Treasury, 1939-1940 and 1946-1970, supplemented by Federal agency published and unpublished reports; 1941-1945, Annual Report of the Secretary of the Treasury, Combined Statement of Receipts, Expenditures, and Balances of the United States Government and agency reports.
The definition of Federal grants used in compiling these series differs from that used by the Treasury Department. These data are confined to grants for cooperative Federal-State or Federal-local programs administered at the State and/or local level and to those programs in which the bulk of the funds is channeled through agencies of State and local governments. Emergency grants and the value of grants-in-kind, such as surplus foods distributed domestically or Braille materials for the blind, are included when they conform to these criteria. Shared revenues and payments in lieu of taxes are excluded from series Y 638-651 although included in the Treasury series, as are programs in which the States or localities act solely as agents of the Federal Government. Loans are excluded by defnition.
The categories of grants (health, education, etc.) follow the organization of programs in the Social Security Administration's social welfare expenditures series, with the addition of the "Highways" and "All other" groups. "All other" grants are often presented with further breakdown of "Urban affairs," "Agriculture and natural resources," and "Miscellaneous" grants. A detailed list of the grants programs in each group can be found in the source annual as well as
in the Federal grants article in the Social Security Bulletin, usually in the June issue.

## Y 652-848. State and local government finances, 1902-1970.

Source: See source for series Y 505-566.
Periodic surveys of State and local government finance began in 1850; for that year and 1860 the data were published in conjunction with reports of the population census. For 1870-1922, the State and local government data were reported at approximately decennial intervals under the title, Wealth, Debt, and Taxation; for 1932, as Financial Statistics of State and Local Governments; and for 1942, 1957, 1962, and 1967, as the Census of Governments.
Census Bureau statistics on governmental finances, as initially published, have been broadly comparable within the three periods: Pre-1937, 1937 to 1950, and 1951 and subsequent years, but are less directly comparable from one period to another. The financial statistics shown here for 1950 and earlier years are substantially taken from several earlier studies, by which the statistics for particular years, as originally published, were recast and supplemented to derive comprehensive data in terms of the basic classification pattern which has applied since 1951.
For a summary discussion of the periodic censuses and annual Census Bureau reporting on governmental finances, see Census of Governments, 1967, vol. 6, No. 5: Historical Statistics on Governmental Finances and Employment, pp. 6-12. That report, and the similar "Historical" reports from the 1962 and 1957 censuses on governments present comparable nationwide data, by level of government, for selected years back to 1902, outline data classification changes, discuss the development of historically consistent data, and cite key source documents. They also provide combined State-local figures, by State, for selected years back to 1942.
For financial statistics of the individual State and local governments in 1967, see the detailed reports of the Census of Governments, 1967, especially vol. 4, presenting a separate bulletin for each State area.
For financial statistics in detail for the individual State governments, see the annual compilation by the Bureau of the Census, State Government Finances, issued for 1942-1957, as Compendium of State Government Finances; and for 1915-1941, as Financial Statistics of States. There were no volumes for 1920 and for 1932-1936; partial data were published for 1921; and data for 1932 were collected for 41 States but were not compiled fully or published.

Reports for earlier years used systems different from those applied since 1951. Figures for individual States on the later reporting basis are available in Bureau of the Census, Revised Summary of State Government Finances, 1942-1950, (State and Local Government Special Studies No. 32, 1953).

For detail for individual large city governments, and in many years for every city with population above 25,000 or 30,000 , see the annual compilations published by the Department of Labor for 1898-1901 and by the Bureau of the Census for 1902-1941 (with gaps for the years 1914 and 1920), as Financial Statistics of Cities (with early variations in title), for 1942-1957, as Compendium of City Government Finances, and since 1957, as City Government Finances. Prior to 1932, the city statistics covered cities of 30,000 inhabitants or more in the preceding decennial census. For 1932-1941, coverage was limited to cities of 100,000 or more; for 1942-1959, the population minimum was 25,000 ; and beginning 1960, a 50,000 minimum has been applied. Since 1956, nationwide aggregates have been published annually, including sample-based estimates for the smaller municipalities.

A series on county governments also was published for 1943-1946, following the inclusion of all county governments in the Census of Governments for 1942. The county series yielded nationwide aggregates of county transactions and individual statistics for large counties.

In 1918-1924, railroads and other public utility corporations frequently reported only net income, resulting in understatements estimated at $\$ 5$ billion in 1918 and 1919 and nearly twice that amount in 1920 and 1921; not estimated for 1922-1924.

2 Excludes liquidating dividends.
3 For 1941-1943, includes a small amount of surtax from returns with no net income but with partially tax-exempt interest from Government obligations. For 1941-1970, includes a small amount of tax from returns with no net income because of special provisions for insurance companies; for 1963-1970 includes tax from recomputing prior
year in vestment credit; for 1967-1970, includes the surcharge; and for 1969-1970, includes the additional tax for tax preferences.
${ }^{4}$ Prior to 1927 , included among those reporting no net income. The declared-value excess profits tax includes a small amount of tax from returns with no net income because the excess profits tax applied to interest on Government obligations exempt from income tax.
${ }^{7}$ Gross income. "Total receipts" is not available separately for returns with net income and returns with no net income.

Not tabulated.
Amount of deficit for returns with no net income is not available.

NA Not available.
${ }_{2}^{1}$ Includes fiduciary returns with net income filed on Form 1040, 1913-1936.
${ }^{3}$ Tax for 1924-1931, after earned income credit and capital loss credit; 1982-1933,
after capital loss credit only; 1943, after foreign tax credit and tax paid at source. Tax for 1940-1941 includes defense tax and for 1943, victory tax
${ }^{4}$ Somewhat understated because net income was used also as total income on returns with ineome of $\$ 1,000$ to $\$ 2,000$. 5 Data pertain to last 10 months of year.

[^247]Series Y 412-439. Individual Income Tax Liability and Effective Rates, for Selected Income Groups: 1913 to 1970-Con.

[^248]${ }^{9}$ Includes net victory tax. Computed by assuming that deductions are 10 percent of victory tax net income; i.e., that victory tax net income is ten-ninths of selected net income.
10 Includes defense tax.
${ }_{11}^{11}$ Rates and exemptions for 1936 and 1938 acts were identical and resulted in the
same tax liabilities.
12
Normal tax rates of 1928 act were reduced for 1929 only by Joint Resolution of Congress.
${ }_{13}^{13}$ Provisions of 1926 act were retroactive to 1925.
${ }^{14}$ Mar. 1, 1913-Dec. 31, 1915.
${ }_{10}^{15}$ Tax liability divided by stated net income.

Series Y 440-449. Federal Estate Tax Returns: 1916 to 1970
[nf thousands of dollars, except number of returns]

Series Y 450-456. Federal Gift Tax Returns: 1924 to 1966
[In thousands of dollars, except number of returns]

## NA Not available

${ }^{1}$ Effective Jan. 3, 1949, amounts refunded by the Government, principally for overpayment of taxes, are reported as deductions from total receipts rather than as outlays. Also, effective July 1, 1948, payments to the Treasury, principally by wholly owned Government corporations for retirement of capital stock and for disposition of earnings, are excluded in reporting both budget receipts and outlays. Neither
change affects the budget surplus or deficit. Figures beginning with fiscal 1913 have change affects the budget surplus or deficit.
been adjusted accordingly for comparability.
${ }^{2}$ Includes interest payments by Government corporations and other business-type activities on securities issued to the Treasury.
${ }_{3}$ Beginning 1954 , undistributed intrabudgetary transactions are deducted from total. Beginning 1932, interfund transactions are deducted lrom total.
Excludes education and training.
${ }_{5}$ Social Security trust fund outlays are reflected under the Department of the Treasury through fiscal 1962, and under the Department of Health, Education, and Welfare, hereafter.
${ }^{\circ}$ Includes military assistance.

# Armed Forces and Veterans (Series Y 849-1031) 

## Y 849-855. Estimates of total cost of U.S. wars.

Source: U.S. Congress, Joint Economic Committee, The Military Budget and National Economic Priorities, part I, pp. 149 and 150, 91st Congress, 1st session (statement of James L. Clayton, University of Utah, at Hearings before the Subcommittee on Economy in Government); and for series Y 853, U.S. Veterans Administration, Annual Report of Administrator of Veterans Affairs.

Details concerning individual estimates and the sources used by Professor Clayton are given in the source document.

An earlier study, Cost of U.S. Wars (typewritten form), was made by Raymond E. Manning, Senior Specialist in Taxation and Fiscal Policy, Legislative Reference Service, The Library of Congress, October 1956. This report gives details as to the period covered, the costs which are included and those excluded, and the assumptions and statistical method used for the computations for each war from the American Revolution through the Korean conflict.

## Y 856-903. Selected characteristics of the Armed Forces, by war.

Source: The President's Commission on Veterans Pensions, Veterans' Benefits in the United States, vol. I; Staff Report No. IV, "Veterans in our Society," House Committee Print 261, 84th Cong., 2d session; and revised estimates prepared by the Department of Defense.

The time coverage for a particular war may vary from series to series. See source for exact coverage.

The number of personnel serving in the Revolutionary War is not known, but estimates range from 184,000 to 250,000 . In the War of 1812 , it is estimated that 286,730 served and in the Mexican War, 78,718. In the Civil War, estimates for Confederate forces range from 600,000 to $1,500,000$.

## Y 904-916. Military personnel on active duty, 1789-1970.

Source: U.S. Department of Defense, reports and unpublished data.
Primary sources of Army data are as follows: 1789, 1794, and 1795, American State Papers, Military Affairs, vol. 1 (except for officers, 1789, Thomas H. S. Hamersly, Complete Regular Army Register of the United States for One Hundred Years (1779-1879), Washington, D.C., 1880); 1801-1821, American State Papers, Military Affairs, vol. 2; 1822-1939, War Department Annual Reports (except as follows: Regular Army, 1847 and 1866, Francis B. Heitman, Historical Register and Dictionary of the United States Army, vol. 2, Washington, D.C., 1903; Army Nurse Corps, 1920, Army field clerks, 1917, and Quartermaster Corps field clerks, 1917 and 1918, Special Report 196, Revised, Statistics Branch, War Department, General Staff, 1927; 1919 and 1920, Quartermaster Corps field clerks, Regular Report 189, Statistics Branch, War Department, General Staff, 1922; 1940-1957, Office of The Adjutant General, Strength of the Army, monthly reports. For data on U.S. Military Academy cadets, 1802-1821, American State Papers, Military Affairs, vol. 2; 1822-1920, Offcial Register of the Officers and Cadets at the United States Military Academy (except as follows: 1871, 1910, 1913, 1915, 1917, and 1918, War Department Annual Reports) ; 1921-1941, War Department Annual Reports; 19421970, Strength of the Army, monthly reports.

Some of the figures for the Navy and Marine Corps appear in the following sources: Gordon R. Young (ed.), Army Almanac, Stackpole Company, Harrisburg, Pennsylvania, 1959; Bureau of Navy Personnel, Navy and Marine Corps, Military Personnel Statistics, June and December 1956; Navy Department, Bureau of Personnel, Progress Report, March 1948.

Officers include warrant officers, flight officers, nurses, medical specialists, and field clerks. Enlisted personnel include U.S. Military Academy cadets, U.S. Naval Academy midshipmer, U.S. Air Force Academy cadets, and other officer candidates.

Army data (series Y 905-907) begin with 1789, the year in which the Department of War (now Department of the Army) was established. Although a "regular" Army has existed continuously from that time, the total strengths cannot be documented from available records, nor can reliable estimates be made for 1790-1793 and 17961800. Beginning 1861 , the data include all military personnel on extended active duty with the Army (Regulars, volunteers, militia, inductees, Reserves, National Guardsmen, and reactivated retired Regular personnel) and U.S. Military Academy cadets. Data prior to 1861 are for Regular Army and cadets only, except for 1836-1840 (Seminole Indian War) and 1846-1848 (Mexican War). Source documents for other years do not contain adequate strength statistics on nonregular personnel called out during the War of 1812 or for short periods of service during the numerous Indian disturbances. For most years prior to 1878 , data were compiled from the latest returns received; some of the reports used, especially those from the frontier garrisons, were weeks or months in transit.

The Army figures include the Army Nurse Corps beginning 1898; Army field clerks and field clerks in the Quartermaster Corps for 1917-1925; warrant officers beginning 1919; flight officers for 19431947; and the Women's Army Corps (formerly the Women's Army Auxiliary Corps) and the Women's Medical Specialist Corps (later redesignated the Army Medical Specialist Corps), beginning 1943. All data for these categories are as of June 30, except the 1898 figure for the Army Nurse Corps which is as of September 15.

The Army Nurse Corps became a part of the permanent Army military establishment in 1901. It traces its origin, however, to 1898, when authority was received to employ by contract as many nurses as needed during the war with Spain. For this reason, data on nurses have been included for 1898-1900.

The positions of Army field clerks and field clerks in the Quartermaster Corps were created by Act of Congress, August 29, 1916. Field clerks of both classes were subject to the rules and articles of war, and had the status of officers, although not commissioned officers. By Act of Congress, April 27, 1926, the Secretary of War was authorized and directed to appoint as warrant officers all field clerks then in active service.

The Army figures for 1908-1947 include strength of the Army Air Force and predecessor agencies. Those beginning with 1948 consist of military personnel under the command of the Army only, resulting from the establishment of the Department of the Air Force as an executive department by the National Security Act of 1947. Data for 1948 and 1949 include a small number of Department of the Air Force military personnel assigned for duty with Army commands, and data for 1948-1955 exclude a larger number of Department of the Army military personnel assigned for duty with Air Force commands.

Navy data for 1794,1795 , and 1798 are an approximation of the "on board" personnel authorized by Congress in conjunction with the construction of six frigates to reconstitute a Navy which had existed for 1775-1785 under the Continental Congress. A separate Navy Department was authorized and organized in 1798. Since the crews usually were obligated, during the early years of the Navy, for only a specific sailing or mission, rather than a continuous tour of duty, the strengths shown are more in the nature of averages and are therefore noted as estimated. Data exclude an unknown number of Naval Militia, supplied by the States, who served during the War of

1812, the Mexican War, and the Spanish-American War. Since 1916, naval reservist and retired personnel on extended active duty have been included.
The Marine Corps was founded in 1775 by the Continental Congress and served during the Revolutionary War, but ceased to exist in 1783. It was reactivated in 1794 when Congress authorized the building of the six frigates and a small number of marines were used as guards. The data in series Y 914-916 begin with 1798, since reliable estimates are not available for prior years. Since 1917, reservist and retired personnel on active duty have been included.

Y 917-926. Classification of selective service registrants, 1940-1970.
Source: U.S. Selective Service System. Series 917, 1940, Selective Service in Peacetime, Appendix 20. Series 917-925, 1941-1947, Summary Reports of Classification, Continental United States, March 31, 1941-April 1, 1947, vol. 1, parts 1-3; 1948-1950, Statistics and Special Reports Digests, September 1948-September 1951, U.S. Summary, vol. 1, part E; 1951-1952, Statistics-Periodic Reports of Classifications, U.S. and State Summaries, October 1951-February 1956, vol. II, part B, section 1, Regular Registrants; 1953-1970, compiled from Selective Service System Form 116. Series 926, 1940-1945, Quoias, Calls, and Inductions, Special Monograph No. 12, vol. II, Appendices F-H; 1946-1947, unpublished data; 1948-1970, compiled from Selective Service Form 262.

The Selective Service System is responsible for the registration, examination, classification, selection, and delivery for induction into the Armed Forces of all men required by law to register, or, in lieu of induction, for ordering them to perform civilian work. The law also provides exemptions or deferments from service for many persons for reasons of previous service, essential occupation, family dependency, etc.
The Selective Training and Service Act of 1940 , which became law on September 16, 1940, was the first peacetime conscription law in U.S. history. The classification system under that Act provided for classification of registrants into four main groups in the order of their being called into the Armed Forces: Class I, persons available for training and service after the physical examination; Class II, persons available for training and service but temporarily deferred as necessary in defense industries for varying periods up to six months; Class III, persons who had dependents requiring their support; and Class IV, persons who were exempted from training and service by statute, or were nondeclarant aliens, or had completed military service (up to Pearl Harbor), or conscientious objectors against both combatant and noncombatant service, or who were physically, mentally, or morally unfit for service. Within these main classes there were certain subdivisions which indicated more specifically the status of the registrants.

For details concerning changes over time in legislation, classification, registration regulations, etc., see the annual and semiannual reports of the Director of the Selective Service System and the System's series of special monographs. A list of monographs covering the early years appears on the inside front cover of Quotas, Calls, and Inductions, cited in the source note.

Y 927-942. Disposition of defendants charged with violation of selective service acts, 1945-1970.

Source: U.S. Administrative Office of the U.S. Courts, Federal Offenders in the United States District Couris, 1970, table H10.
Statistics reflect defendants charged with violations of the Selective Training and Service Act of 1940 and the Universal Military Training and Service Act of 1948.
These data exclude District of Columbia, Canal Zone, Guam, and Virgin Islands.

Y 943-956. Estimated number of veterans in civil life, by age, 18651970.

Source: U.S. Veterans Administration, reports and unpublished data.

Age distribution for veterans of World War 1, Spanish-American War, Civil War, Mexican War, and War of 1812 were obtained by procedures used in estimating the number of living veterans in civil life, as described in the text for series Y 957-970. The ages for veterans of Indian wars and Regular Establishment (peacetime service) were obtained from records of the Veterans Administration and predecessor agencies. Age distribution for Regular Establishment veterans is not included after 1965.

The ages of World War II veterans included in the total for 1945 were based on the ages of those veterans on the Veterans Administration disability compensation rolls on June 30, 1945. The estimated number of veterans by age, for 1950 and thereafter, were derived by the application of appropriate survival rates to the male and female components of the potential World War II veteran population as of July 25, 1947. In this particular case, the potential World War II veteran population is defined as: (a) The estimated number of men and women who had served in World War II and who had returned to civil life prior to July 25,1947 , and (b) those still in the service as of July 25, 1947. The age distribution of this population was derived from the Veterans Administration's sample of approximately 1 percent of the records of the men and women separated from the Armed Forces between September 16, 1940, and July 25, 1947, and from estimates provided by the Armed Forces for World War II participants who were still in service on the latter date.

The ages of Korean conflict veterans included for 1955 and thereafter were derived from the Veterans Administration's sample of approximately 1 percent of Department of Defense records for persons returning to civil life between June 27, 1950, and June 30, 1970.

The ages of veterans who served between the end of the Korean conflict and the inception of the Vietnam era included in 1966 and thereafter were derived from the Veterans Administration's sample of approximately 1 percent of Department of Defense records for persons returning to civil life in the period February 1, 1955, through August 4, 1964.

The ages of veterans who served in the Vietnam era included in 1966 and thereafter were derived from the Veterans Administration's sample of approximately 1 percent of Department of Defense records for persons returning to civil life between August 4, 1964, and June $30,1970$.

Y 957-970. Estimated number of veterans in civil life, by period of
service, $1865-1970$. service, 1865-1970.
Source: U.S. Veterans Administration, reports and unpublished data.

The estimates for the War of 1812 were derived by a backward chain computation involving the application of appropriate survival rates to the age distribution of the 165 living veterans of this war on the pension rolls in 1892. It was assumed that all living veterans of the War of 1812 were on the pension rolls after 1873.

Estimates for the Mexican War were computed by applying appropriate survival rates to the age distribution of the 2,195 living Mexican War veterans on the pension rolls in 1907. For 1890 and later years, the estimates were based on the assumption that 90 percent of the living Mexican War veterans were on the pension rolls. Estimates for years prior to 1890 were based on a backward chain computation.

Estimates for the Indian wars include only veterans on pension rolls of the Veterans Administration or predecessor agencies.

The Civil War estimate for 1865 was based on Armed Forces data. Estimates for years after 1865 were computed from actuarial projections, based on the American Experience Mortality Table, 1868, applied to the age distribution of one million Civil War participants included in Surgeon General, The Medical Department of the U.S. Army
in the World War, vol. XV, Statistics, part I, 1921. The totals so obtained were modified by the assumptions that 75 percent of the living Civil War veterans were on the pension rolls in 1900-1915 and that practically all living Civil War veterans were on the rolls in 1920 and later years. The estimates pertain to Union forces only.
For the Spanish-American War, estimates for 1905 and later years were computed by application of appropriate survival rates to the 1902 age distribution of Spanish-American War participants (not shown here). For 1900, the estimate is based on total participants, inservice deaths, and discharges to civil life.
Estimates for World War I were computed by applying appropriate survival rates to the 1918 distribution of World War I participants by year of age based on records of 3.7 million War Risk Insurance applications (The Medical Department of the U.S. Army..., cited above).

For World War II, the Korean conflict, the Vietnam era, and service between the Korean confict and Vietnam era, the estimates were derived from Armed Forces data on the number of persons returned to civil life less Veterans Administration estimates of deaths and less the number who reenlisted from civil life.
Data on the Regular Establishment include only former members of the peacetime forces receiving disability compensation or pension from the Veterans Administration or predecessor agencies.

The following periods are covered by the specified wars for determining veterans status:

War of 1812-June 18, 1812, through February 17, 1815
Mexican War-April 25, 1846, through May 30, 1848
Civil War-April 12, 1861, through April 13, 1865
Indian wars-1817 through 1898 (approximately)
Spanish-American War-April 21, 1898, through July 4, 1902
(includes the war with Spain, Boxer Rebellion, and Philippine Insurrection. For persons serving in the Moro Province, hostilities ended July 15, 1903)
World War I-April 6, 1917, through November 11, 1918
(for persons serving in Russia, the war ended April 1, 1920)
World War II-September 16, 1940, through July 25, 1947
Korean conflict-June 27, 1950, through January 31, 1955
Service between Korean conflict and Vietnam era-February 1, 1955, through August 4, 1964
Vietnam era-service after August 4, 1964
Y 971-983. Expenditures of Veterans Administration and predecessor agencies from appropriated funds, by period of service, 1790-1970.

Source: U.S. Veterans Administration. Original data are taken from annual reports of the Administrator of Veterans Affairs, Veterans Bureau, Bureau of Pensions, National Home for Disabled Volunteer Soldiers, and records of the Veterans Administration.

The data pertain to expenditures from appropriated funds (see text for series Y 984-997) for veterans and their dependents through June 30, 1970. Thus, they include expenditures for pensions since 1790 and for care in the National Homes (now Veterans Administration domiciliaries) since 1867. Grants-in-aid for the care of veterans in State homes were first made in 1889 and are included thereafter.

Expenditures on behalf of World War I veterans, made originally as allowances for the dependents of enlisted men in the Armed Forces, compensation for death and disability, medical care and treatment, vocational rehabilitation and training, and insurance against death or permanent disability, are included since October 1917. Subsequent adjustments of benefits for World War I veterans and for veterans of the earlier wars (e.g., extension of hospital benefits) are reflected in the ensuing years. Expenditures for World War II veterans began in 1941, and for veterans of the Korean conflict in 1951.

Trust and working fund expenditures (e.g., the U.S. Government Life and National Service Life Insurance Trust Funds, the Adjusted Service Certificate Trust Fund, and the General Post Fund) are excluded; transfers from appropriations to the insurance trust funds, however, are included. Also exciuded are expenditures made by
other Federal and State agencies (e.g., unemployment compensation paid to Korean conflict veterans by the Department of Labor, expenditures for retirement pay by the Department of Defense, and bonus payments made by State governments).

Of the $\$ 174.8$ billion in total expenditures through 1970, $\$ 139.0$ billion ( 79 percent) was directly allocated by war. The distribution of the remaining expenditures was estimated. Therefore, the figures are subject to a varying and unknown degree of error. For example, variations in average hospital costs between wars, or unusual administrative workloads are not reflected in the distribution factors used.
Y 984-997. Expenditures for veterans benefits and services by Veterans Administration and predecessor agencies, 1790-1970.
Source: U.S. Veterans Administration, Annual Report of the Administrator of Veterans Affairs, various issues, and unpublished data.

Data are based on checks paid through December 31, 1947, and on vouchers approved for payment thereafter. The data are gross, since they include expenditures made from amounts earned (in the form of reimbursements) by the various accounts. Expenditures from revolving funds are also gross, i.e., receipts have not been netted out of these funds except in minor instances noted elsewhere. Accordingly, these data do not agree with those reported in the statements of the Treasury Department and the Bureau of the Budget.

Y 984, total expenditures. This series measures the gross cost of benefits and services (including capital expenditures and administrative costs) provided veterans and their beneficiaries, irrespective of the source of funds. Included are expenditures from general and special funds appropriated by the Congress, revolving and management funds authorized to finance a continuing cycle of operations using receipts derived from these operations, and trust funds held by the Government for the benefit of veterans and their beneficiaries. Transfers from appropriations to insurance trust funds, from which the actual expenditures are made, are not included in the total, in order to avoid duplication. Expenditures from the Veterans Administration Revolving Supply Fund, established July I, 1954, also are excluded from the total, since these amounts generally duplicate expenditures made by Veterans Administration administrative appropriations for supplies, equipment, and certain services procured through the fund.
Y 985, compensation and pensions. Data represent total expenditures less refund of overpayments.
Y 986, insurance and servicemen's indemnities. Data include direct payments to beneficiaries from insurance appropriations, servicemen's indemnities, and benefits and dividends paid from insurance trust funds. Some noncash transactions (e.g., interest credited to dividends left on deposit) also are included as expenditures from the trust funds. Transfers from appropriations to the insurance trust funds, from which the benefit payments are made, are not included in these amounts. Beginning fiscal year 1949, the reporting of expenditures from the U.S. Government Life Insurance and National Service Life Insurance trust funds was changed from a net to a gross basis. This resulted in an understatement in varying amounts for prior years. The cumulative differences for the prior years between the net figures and what the figures would have been on a gross basis have been added in a lump sum to the 1948 figures. This adjustment amounted to $\$ 295,651,000$.

Y 987, education and training. This series includes subsistence allowances, tuition, supplies, and equipment of veterans training under Public Law 346, education and training allowances to veterans training under Public Law 550, veterans and servicemen training under Public Law 89-358, and educational assistance for dependents and survivors of totally disabled or deceased veterans under Public Laws 634, 88-361, and 90-631.

Y 988, vocational rehabilitation. Data include subsistence allowances, tuition, supplies, and equipment of veterans training under Public Laws 16, 894, and 87-815, and vocational rehabilitation allowances for World War I veterans.

Y 989, unemployment and self-employment allowances. Includes allowances to World War II veterans to assist in their readjustment to civilian employment. Similar allowances paid to Korean conflict and Vietnam veterans by the Department of Labor are excluded.

Y 990, loan guaranty. Includes payments on defaulted loans, and the cost of property and securities acquired. The amounts are gross and do not reflect the cost of the loan guaranty program to the Government. Refunds and recoveries on claims paid returned to the general fund and deposits to the loan guaranty revolving fund amounted to $\$ 2.9$ billion through June 30, 1970. Other losses of the program are subject to further recovery from the liquidation of securities and repayments by borrowers.

Y 991, direct loans. Includes direct mortgage loans and advances to veterans, interest expenses on capital borrowed from the U.S. Treasury, and other expenses (excluding Veterans Administration administrative expenses) of the direct loan program. Expenditures are gross and do not reflect the cost of this program to the Government. Through June 30, 1970, receipts paid into the direct loan fund amounted to $\$ 3.1$ billion, bringing net expenditures to $\$ 108$ million. This will be further reduced, as the program matures, by payments of interest and principal by borrowers.

Y 992, miscellaneous benefit payments. Includes statutory burial allowances; expenditures not classified as to purpose from the compensation and pensions appropriation; automobiles and other conveyances for disabled veterans; specially adapted homes for paraplegic veterans; payments to participants in the yellow fever experiments; military and naval family allowances of World War I veterans; marine and seamen's insurance in World War I; adjusted service compensation (World War I bonus); General Post Fund expenditures; withdrawals of the personal funds of patients held by the Veterans Administration as banker and funds due incompetent beneficiaries; soldiers' and sailors' civil relief; and the vocational rehabilitation revolving fund. These expenditures are gross with the exceptions of soldiers' and sailors' civil relief and the vocational rehabilitation revolving fund, which are on a net basis.

Y 993, medical, hospital, and domiciliary services. Figures include expenditures for hospital nursing bed care, and domiciliary care, out-patient medical and dental treatment, medical research, and related costs; appropriations to the Canteen Service Revolving Fund; and grants to the Republic of the Philippines for medical care and treatment of veterans. Beginning 1921, the data are estimated. Prior to July 1, 1879, the fiscal year of the National Home for Disabled Volunteer Soldiers ended on various dates. For this period, the data have been proportionately adjusted by the Veterans Administration to reflect expenditures for years ending June 30 .

Y 994, hospital and domiciliary facilities. These data include expenditures for the construction and equipping of hospitals and domiciliary facilities, and major alterations, improvements, and repairs thereof; grants to the Republic of the Philippines for the construction and equipping of a hospital; grants for construction of State extended care facilities; expenditures from funds allotted under the National Recovery Act of 1933 and Public Works Administration Act of 1938; and $\$ 436,623,692$ transferred to the Department of the Army, Corps of Engineers, for the construction of hospitals.

Y 995, administration and other benefits. Includes expenses for vocational counseling of veterans, beneficiary travel for certain programs, reporting allowances paid schools for certifying the attendance of veteran trainees, private laws for relief, and all administrative salaries and expenses.

Y 996-997, expenditures from general and special fund appropriations. Series Y 996 represents expenditures from appropriations made by the Congress to finance the general and ordinary operations of the Veterans Administration and predecessor agencies. The figures differ from amounts shown under total expenditures (series

Y 984) after 1917 in that they do not include expenditures from trust funds, working funds, and deposit funds. Transfers from appropriations to insurance trust funds (series Y 997) are included in the figures for series Y 996.
Y 998-1009. Veterans pensions and compensation-number of veterans and expenditure, by type, 1866-1970.
Source: U.S. Veterans Administration, records. Data were compiled from various annual reports of the Administrator of Veterans Affairs, and of the Commissioner of Pensions.

The basic distinction between pension and compensation is that pension is a benefit payable for total and permanent disability or death which is not attributable to the veteran's military service. Compensation is payable for the disability or death resulting from injury or disease incurred in, or aggravated by, military service. In the series relating to death benefits, the number of veterans refers to the number of deceased veterans whose dependents are receiving benefits, rather than to the number of dependents in receipt of such benefits; the data on expenditures refer to the amount received by these dependents. In the disability cases, the data refer to the number of veterans, and the amount of money paid to these veterans in the form of retirement pay administered by the Veterans Administration or its predecessor agencies.

For 1866-1890, separate data are not available for the death and disability series. Likewise, information is not available which would permit a separation of the data on the pensions and compensation earned for military service prior to 1904. As a result, all data on veterans of the Spanish-American and earlier wars have been arbitrarily included in the pension series.

The compensation data refer (with the qualifications as noted above for the series on deaths) to the number of, or expenditures paid to, veterans of the Regular Establishment, World War I, World War II, the Korean conflict, and Vietnam. Data on these veterans were first included in 1904, 1918, 1942, 1951, and 1965, respectively.

Y 1010-1027. Patients receiving hospital or domiciliary care authorized by Veterans Administration, 1921-1970.
Source: U.S. Veterans Administration, Annual Report of the Administrator of Veterans Affairs, various issues, and unpublished data.

These data do not in all cases agree with information previously published in some of the earlier annual reports of the Veterans Administration. Revisions were made to adjust some of the data for earlier years for comparability with current data.

The data for admissions is by type of patient; through 1960 neurological patients were included with neuropsychiatric, thereafter with general. Tuberculosis patients are included with general.

The data for all veterans receiving hospital care (series Y 1014) and veterans with service-connected disabilities (series Y 1019) are identical prior to 1925. The act which made Veterans Administration hospital care available to veterans with nonservice-connected disability was passed in 1924, and it was not until 1925 that such patients were admitted to Veterans Administration hospitals.

Data for veterans receiving hospital care for service-connected disabilities (series Y 1019-1022) exclude those veterans with serviceconnected disabilities who are being treated for nonservice-connected ailments.

Series Y 1018 shows the number of nonveteran patients in Veterans Administration hospitals. This group of patients is made up for the most part of persons still in the military service who have not yet attained veteran status, and cases admitted to Veterans Administration hospitals for humanitarian reasons.

Domiciliary care was provided by the National Homes for Disabled Volunteer Soldiers through July 30, 1930; later, it was provided by other agencies. The number of veterans in State homes receiving domiciliary care (series Y 1025) is shown because the Veterans Administration contributes to the support of veterans cared for in approved State homes who would be eligible for admission to Veterans Administration domiciliaries.

Y 1028-1031. Government life insurance administered by Veterans Administration-number of policies, income received, and benefits paid, 1921-1970.

Source: U.S. Veterans Administration, Annual Report of the Administrator of Veterans Affairs, various issues, and unpublished data.

The U.S. Government, through the Veterans Administration, operates two life insurance programs for veterans and servicemen. The insurance program which had its origin in World War I is known as U.S. Government Life Insurance (USGLI); and the program which had its inception in 1940 is called National Service Life Insurance (NSLI). The administrative expenses of these programs are borne by the U.S. Government. All USGLI is participating (that is, entitled to dividends from any earnings). This program was closed to new issues effective April 25, 1951. All NSLI issued prior to April 25,1951 , with some minor exceptions, is participating and entitled to dividends. This type of insurance also was closed to new issues in 1951. Veterans separated from military service without a serviceconnected disability on or after April 25, 1951, and before January 1, 1957, could apply for nonparticipating NSLI on the 5-year nonconvertible term plan only. Conversion to permanent plans was made available in 1959. This insurance is known as Veterans Special Life Insurance.

Veterans separated with a service-connected disability on or after April 25, 1951, are eligible to apply, within one year after serviceconnection is established, for permanent plan or term policies. This insurance is known as service-disabled veterans insurance.

In 1964 Congress enacted legislation which provided for a limited reopening of NSLI for a period of one year beginning May 1, 1965, to qualifying disabled veterans. To qualify they must have been eligible to buy National Service Life Insurance between October 8 , 1940, and January 1, 1957, and have had either (1) a service-connected disability or (2) a nonservice disability, or a combination of service
and nonservice disabilities so serious that they could not obtain commercial insurance at the highest rates. This insurance is known as Veterans Reopened Insurance.

The maximum amount of all Government insurance for veterans is $\$ 10,000$ on one life. Excluded from these series are data on the Servicemen's Indemnity program, which was in effect from June 27, 1950 , to January 1, 1957. This program provided free life insurance in the amount of $\$ 10,000$ (less any USGLI or NSLI in force) while in military service and for 120 days thereafter.

Income received (series Y 1030) includes: (1) Premiums received from policy holders for insurance and disability income benefits, including premiums waived because of disability, (2) advances from Congressional appropriations to the service-disabled veterans insurance fund, (3) interest on investments in U.S. Treasury Certificates of Indebtedness and in U.S. Treasury notes, (4) interest on policy loans and on premiums paid in arrears, (5) dividends credited to insureds or deposited to accumulate at interest, and (6) reimbursements from the U.S. Government as the Government's contribution for death and disability claims due to the extra hazards of military or naval service, for gratuitous insurance, and for other obligations.

Benefits paid (series Y 1031) include: (1) The actual cash payments to beneficiaries of deceased insureds, (2) cash payments to insureds under the total and permanent disability provisions of USGLI policies, (3) monthly income payments under total disability income provisions of USGLI and NSLI policies issued before April 25,1951 , (4) premiums waived for total disability, (5) cash surrender values paid on contracts surrendered, (6) payments on matured endowment policies, (7) dividends paid and dividends previously credited or left on deposit and later withdrawn, (8) interest added on dividend credits and deposits, (9) adjustments in policy liens, receivables, and overpayments waived, (10) transfers to U.S. Government in the Veterans Special Life Insurance program, and (11) administrative costs in the Veterans Reopened Insurance program.

# Colonial and Pre-Federal Statistics 

## Z 1-615. General note.

It would have been possible to distribute these series for the colonial and pre-Federal period among the chapters covering each of the appropriate subject fields. It was felt, however, that a separate chapter especially organized to cover this period would be more valuable in itself and would also provide a more suitable, less-exacting context for the statistics, many of which are relatively roughhewn.

In the past, statistics for the colonial and pre-Federal period were largely dependent on compilations made during the 17 th and 18 th centuries by historians such as Whitworth and Macpherson. Presentday scholars, however, no longer rely solely upon such compilations. They are ferreting out statistical information from original records hitherto left unused in archives and reconstructing statistical series of their own from other sources. Several of the series presented here are appearing in print for the first time. Compilers of the new series are identified in the source citations.

The Public Records Office in London (sometimes hereafter abbreviated PRO) contains many collections of records which throw light on commerce between England and the colonies and to some extent on the development of agriculture and manufacturing in the colonies, particularly when considered with reference to the mercantilist laws passed by the mother country, as has been done here. The laws in question are cited at various points in the text below by reference to their regnal year and chapter numbers-for example, 5 Geo. II c 22 (the fifth year of the reign of King George II, chapter 22).

The collections in the Public Records Office in London, which are the original sources for many of the data presented here, are identified there by title and call numbers. For example, one collection is titled "American Inspector General's Ledgers" and is further identified as "PRO Customs 16/1." The most important of these collections or ledgers of imports and exports are the following: The English Inspector General's Ledgers (PRO Customs 3); the Scottish Inspector General's Ledgers (PRO Customs 14); the American Inspector General's Ledgers (PRO Customs 16/1); and the colonial naval office lists (usually found in C. O. 5).

The English, Scottish, and American Inspector Generals' Ledgers are conveniently arranged for statistical purposes, but are so voluminous that it is far more convenient to utilize contemporary tabulations drawn from them when such secondary sources are available. The lists kept by the naval officers of that period (for the purpose of helping to enforce the navigation laws) merely provide chronological data concerning the ships which entered and cleared port, together with their cargoes and destinations.

The task of using the naval office lists has in some instances been lightened by colonial newspapers, such as the South Carolina Gazette, which published data taken from customhouse records. Also of general assistance in the preparation of many series presented in this chapter are the compilations from naval office lists prepared by a Works Progress Administration project conducted at the University of California, entitled "Trade and Commerce of the English Colonies in America," and referred to below as WPA compilations.

## Z 1-19. Estimated population of American Colonies, 1610-1780.

Source: Compiled by Stella H. Sutherland, Due West, South Carolina, chiefly from the following sources: B. J. Brawley, A Short History of the American Negro, MacMillan, 1913; Elizabeth Donnan (editor), Documents Illustrative of the History of the Slave Trade to America, 4 vols., Carnegie Institution of Washington, D.C., 1930-85; Evarts B.

Greene and Virginia D. Harrington, American Population Before the Federal Census of 1790, Columbia University Press, New York, 1932; Stella H. Sutherland, Population Distribution in Colonial America, AMS Press, Inc., New York, 1966; E. R. Turner, "The Negro in Pennsylvania," Prize Essays of the American Historical Association, Washington, D.C., 1911 ; Bureau of the Census, A Century of Population Growth, 1909; Thomas J. Wertenbaker, The Planters of Colonial Virginia, Princeton, 1922; and George W. Williams, The History of the Negro Race in America From 1619 to 1880, 2 vols., New York, 1883. Also, a wide variety of source material was consulted for general information.)

The original data were obtained from the reports of the colonial officials to the Lords Commissioners of Trade and Plantations. Not infrequently a census supplied sworn evidence of the number of inhabitants; for other reports, the militia or the tax lists or both were used, commonly accompanied by an estimate of the whole population as indicated by the rolls or lists. Estimates made by colonial officials and by other informed contemporaries who did not disclose the figures upon which their conclusions were based have occasionally been included in these series. However, such estimates were selected in accordance with the general pattern of population growth.

The ratio of the militia to the whole population was generally $I$ to $51 / 3$, but there were many exceptions. In Massachusetts, it was 1 to 6 in 1751 and 1 to 4 in 1763; in Connecticut, 1 to 6 in 1722 and 1756 and 1 to 7 in 1749, 1761, and 1774; it was 1 to 6 in Virginia and 1 to 7 in South Carolina at various times. No generalization can safely be made as to the ratio borne by the northern polls and ratables and by the southern taxables and tithables to the whole population of the Colonies. In every Province the figure was different. In the North, it ranged from 1 to 4 to 1 to $51 / 2$; in Pennsylvania, it was 1 to 7 in the 1750 's, but 1 to 5.8 was the more common figure; in Maryland and Virginia, where both male and female slaves appeared on the tax lists, the ratio was 1 to 3 or 3.5 in the 17 th century and 1 to 2.4 or 2.6 in the 18 th century. The North Carolina white taxables were multiplied by 4 and the Negro taxables by 2.

The figures for Negroes for the 17 th century, which are doubtlessly too low, are largely estimates based upon references to purchase and sale, to laws governing slavery, and occasionally to reports of more or less exact numbers.

Z 20-23. Percent distribution of the white population, by nationality, 1790.

Source: American Council of Learned Societies," Report of Committee on Linguistic and National Stocks in the Population of the United States" (based on studies by Howard F. Barker and Marcus L. Hansen), Annual Report of the American Historical Association, 1931, vol. I, Washington, D.C., 1932, p. 124.

Distribution was made primarily on the basis of family names. For explanation of methods used, see source.

Z 24-132. Population censuses taken in the colonies and States during the colonial and pre-Federal period, 1624-25 to 1786.
Source: Compiled by Robert C. Klove, U.S. Bureau of the Census, with the counsel of Stella Sutherland, chiefly from the following sources: Evarts B. Greene and Virginia D. Harrington, American Population Before the Federal Census of 1790, Columbia University Press, New York, 1932 (reprinted by Peter Smith, Gloucester, Mass., 1966) and W. S. Rossiter, A Century of Population Growth, From the

First Census of the United States to the Twelfth: 1790-1900, U.S. Bureau of the Census, 1909.

The original data were obtained as follows:

## Z 24-37, Connecticut.

1756 Connecticut Colony Public Records, XIV, p. 492. Rossiter has made corrections, p. 164. Greene and Harrington give the same figures as Rossiter, pp. 58-61.
1774 Ibid., pp. 485-491. From Rossiter, pp. 166-169. Rossiter has made some corrections in addition from the original records. Greene and Harrington use the same source and give approximately the same figures but do not give as much detail, pp. 58-61.
1782 Jedidiah Morse, American Geography, Boston, 1792, pp. 217-218. From Greene and Harrington, p. 61.
Delaware.

|  | Total | White | Negro |
| :---: | :---: | :---: | :---: |
| 1782 | 44,095 | 41,195 | 2,900 |

From unpublished manuscripts in the State House in Dover, Delaware, examined by Stella Sutherland. Only the census totals for Kent County $(9,782)$ and Sussex County $(12,660)$ are available. Newcastle County is missing, but Sutherland has estimated a total for Newcastle $(21,153)$ which is included in the State total. She also made separate estimates for white and Negro.

## Z 38-49, Maine.

1764-65 Josiah H. Benton, Jr., Early Census Making in Massachusetts, 1643 to 1765, Boston, 1905. With addition corrections by Rossiter, p. 162. Benton used the Crane MS (manuscript) for Massachusetts and Maine which was discovered about 1900. Greene and Harrington also preferred the Crane MS as published by Benton (see footnote a, pp. 21-22). Rossiter's figures are used in this table because they give more detail. The earlier Dana MS was published in Joseph B. Felt, 'Statistics of the Population in Massachusetts" (in American Statistical Association Collections, I, 121-216), Boston, 1897. Felt does not include Negro and other persons and the total population is slightly less.
William D. Williamson, in The History of the State of Maine, 1602-1820, Hallowell, 1839, gives population for the three counties in Maine on p. 373 and also estimates for the plantations which were omitted in the enumeration. His source is the Columbian Centinel published in 1822 which, according to Greene and Harrington, was based on the Dana MS. His total is considerably larger and does indicate that the Dana MS included Negroes.

## Z 50-62, Maryland.

1704 Maryland Archives, XXV, p. 256. From Greene and Harrington, p. 129.
1710 Ibid., pp. 258-259. From Greene and Harrington, p. 129.

1712 Ibid., p. 259. From Greene and Harrington, p. 129.
1755 Gentleman's Magazine, vol. XXXIV, p. 261. With corrections by Rossiter, p. 185. Rossiter gives more detail than Greene and Harrington, pp. 125-126, but the latter have some figures that vary considerably from those given by Rossiter. The total population is only 60 more. Greene and Harrington take their figures from a different source, Maryland Records Miscellaneous, 1755-75, 11 in Force, Transcripts (copied from Ezra Stiles' MS) in Library of Congress Transcripts.

1782 Jedidiah Morse, American Geography, Boston, 1792, p. 350. Also in Greene and Harrington, p. 127. Morse gives a partial breakdown of the totals and indicates that this census was taken by several assessors in March 1782.

## Z 63-77, Massachusetts.

1764-65 See source for Maine, 1764-65. (Addition corrections by Rossiter, p. 161.)
1776 Jesse Chickering, Statistical View of the Population of Massachusetts, 1765-1840, Boston, 1846, p. 9. From Greene and Harrington, p. 17.
1784 Jedidiah Morse, American Geography, Boston, 1792, p. 172. From Greene and Harrington, p. 46.

## Z 78-90, New Hampshire.

1767 Provincial Papers of New Hampshire, vol. VII, pp. 168170. With corrections by Rossiter, pp. 149-150.

1773 Ibid., vol. X, pp. 625-636. With corrections by Rossiter, p. 150.

1775 New Hampshire Historical Society Collections, vol. I, pp. 231-235. From Rossiter, pp. 152-154. Rossiter did not total the figures, which are given by towns. He indicated that the census was incomplete, with data for several towns not reported. The town figures in Greene and Harrington (pp. 74-79), which are town totals only, differ in a few instances from those given by Rossiter.
1786 Provincial Papers of New Hampshire, vol. X, pp. 637-689. With correction by Rossiter, p. 156, and Greene and Harrington, p. 74. Many towns did not distinguish whites, Negroes, and others.

## Z 91-97, New Jersey.

1726 New Jersey Archives, 1st Series, V, p. 164. With corrections by Rossiter, p. 184, and Greene and Harrington, p. 109.

1738 New Jersey Archives, 1st Series, VI, pp. 242-243. With corrections by Rossiter, p. 184, and Greene and Harrington, p. 110. Both report Negroes as "Negroes and Other and Slaves."
1745 New Jersey Archives, 1st Series, VI, pp. 242-243. With corrections by Rossiter, p. 184, and Greene and Harrington, p. 111. Both report Negroes as "Slaves."
1772 New Jersey Archives, 1st Series, X, pp. 452-453. From Stella H. Sutherland, Population Distribution in Colonial America, Columbia University Press, New York, 1936; reprinted AMS Press, Inc., New York, 1966, pp. 98-99. Separate figures for whites and Negroes available for only 8 counties.
1784 New Jersey Department of State: Compendium of Censuses, 1726-1905, Trenton, 1906, p. 41; and Jedidiah Morse, American Geography, Boston, 1792, p. 284.

## Z 98-104, New York.

1698 F. B. Hough, Census of the State of New York, 1855, iv.; also Calendar of State Papers, Colonial Series: America and West Indies, 1697-98, 532, 978, vi. From Rossiter, p. 170, and Greene and Harrington, p. 92.

1703 Ibid., iv. From Rossiter, p. 170, and Greene and Harrington, p. 95.
1712-14 New York Colonial MS, vol. LVII, Secretary's office. From Rossiter, p. 181.
1723 New York Documentary History (ed. E. B. O'Callaghan), Albany, 1849-51, vol. I, p. 693. From Rossiter, p. 181, and Greene and Harrington, p. 96.

1731 rbid., vol. I, p. 694. With corrections, Rossiter, p. 181, and Greene and Harrington, p. 97.
1737 Ibid., vol. I, p. 694. With corrections by Rossiter, p. 182, and Greene and Harrington, p. 98.
1746 Ibid., vol. I, p. 695, not including Albany County. From Rossiter, p. 182, and Greene and Harrington, p. 99.
1749 Ibid., vol. I, p. 695. With corrections by Greene and Harrington, p. 100.
1756 Ibid., vol. I, p. 696. With corrections by Greene and Harrington, p. 101.
1771 Ibid., vol. I, p. 697. With corrections by Rossiter, p. 183, and Greene and Harrington, p. 102.
1786 F. B. Hough, Census of the State of New York, 1855, viii. From Rossiter, p. 183, and Greene and Harrington, p. 104.

Z 105-113, Rhode Island.
1708 Rhode Island Colonial Records, vol. IV, p. 59. With correction from Rossiter, p. 162, and Greene and Harrington, p. 65.
1730 Census in "R. I. State Papers" in Massachusetts Historical Society Collections, 2d Series, VII, p. 113. From Greene and Harrington, p. 66.
1748 See source for 1730. From Greene and Harrington, p. 63.

1755 "Acct. of the People in the Colony of R. I." with Governor Hopkin's letter, Dec. 24, 1755, Proprieties V: 159 (iv), in Historical Society of Pennsylvania Transcripts. From Greene and Harrington, p. 67.
1774 John R. Bartlett, Census of Rhode Island for 1774, Providence, 1858, p. 239. With corrections from Rossiter, p. 162.

1783 Rhode Island Colonial Records, VII, p. 299. With corrections from Greene and Harrington, pp. 69-70.

## Z 114-120, Vermont.

1771 London Documents, xliv, p. 144; New York Documentary History (ed. E. B. O'Callaghan), Albany, 1849-51, p. 474; F. B. Hough, Census of the State of New York, 1955, vii. From Rossiter, p. 183, and Greene and Harrington, p. 102.

## Z 121-132, Virginia.

1624-25 Virginia Magazine of History and Biography (Virginia Historical Society), VII, pp. 364-367; Alexander Brown, First Republic in America, Boston and New York, 1898, pp. 617-627. From Greene and Harrington, p. 144. Irene W. D. Hecht in "The Virginia Muster of $1624 / 5$ as a source for Demographic History," William and Mary Quarterly, Third Series, vol. XXX, No. 1, January 1973, gives the total population as 1,218 and other details.
1634 Virginia Colonial Records, p. 91. "After this list was brought in there arrived a Ship of Holland with 145 persons from Bermudas; and since that 60 more in an English ship from Bermudas also." George Chalmers, Coll. Va., I, p. 18, New York Public Library. From Greene and Harrington, p. 145.
1699 Colonial Office Papers, 5:1312, No. 19, XI in Library of Congress Transcripts; Calendar of State Papers, Colonial Series: America and West Indies, 1701, 635, No. 1040, XI. From Greene and Harrington, p. 137.

1701 Colonial Office Papers 5:1312, No. 19, X. From Greene and Harrington, p. 147-148.

## Z 133-168. General note.

The two basic sources for the study of the colonial Negro are population statistics (see series Z 1-19 and Z 21-132) and commercial statistics concerning slave importations. Although direct knowledge of the colonial Negro's natural increase is scarce, available evidence indicates that this increase must have been considerable. It is reported in 1708 that about half of Boston's 400 Negro servants were born there, and Governor James Glen of South Carolina stated in 1749 that the number of Negroes in his colony increased rather than diminished during the nine years when prohibitive taxes and war "prevented any from being imported" (Elizabeth Donnan, ed., Documents Illustrative of the History of the Slave Trade to America, Carnegie Institution of Washington, D.C., 1935, vols. III and IV, pp. 24 and 303, respectively). Otherwise, discrepancies between import and population figures (especially in later years) would call for the existence of an illegal trade in Negroes of an extent to which other evidence gives little support.

Donnan's Documents . . ., cited above, provides the greatest single source on the subject of the slave trade. She supplies references to many of the varied sources which provide such knowledge as we have of the 17 th century, most helpful of which are the statistical reports prepared to help settle disputes between the Royal African Company and the separate traders.

After the first quarter of the 18 th century, data on the slave trade usually rest upon the colonial naval office lists (PRO C. O. 5). Colonial newspapers sometimes reported the tallies which had been made in the customhouse; Donnan, Documents..., cited above, reproduces the individual entries for most of the lists which have survived, and the WPA compilations (see general note for series Z 1-615) give annual totals. In preparing the series on slaves, photographic copies of the naval office lists (PRO C. O. 5) were used when the Donnan entries and the WPA compilations did not agree. It is important to note, however, that the naval office lists report importations by sea rather than overland movements of slaves. Also, it is not always known how many of the Negroes survived after their entry was recorded. The Virginia statistics for 1710-1718 (Donnan, cited above, vol. IV, pp. 175-181) show that of 4,415 Negro slaves entered, 231 died within the time allowed to recover the duty and 103 were drawn back for exportation- 7.5 percent of the total importations.

In the case of the Southern Colonies, the statistics for Virginia and South Carolina are reasonably complete; those for Maryland and Georgia are spotty; and those for North Carolina are virtually nonexistent.

In New England, the Negro population appears to have been due to natural increase rather than extensive importations. Governor Dudley of Massachusetts reported in 1708 that about one-half of Boston's Negro servants were born there (Donnan, cited above, vol. III, p. 24), and a comparison of the 1768-1773 trade figures, series Z 133-145, with the population figures, series Z $1-19$, suggests that natural increase had become even more important than importations by the revolutionary era.

In the Middle Colonies the first Negroes were probably brought to New York from Spanish or Dutch prizes in 1625 or 1626. Dutch records are meager but show a consignment of 5 in 1660 and another of 300 in 1664 . After the English conquest, New York for a time had an indeterminate trade in slaves with the pirates of Madagascar (Donnan, cited above, vol. III, pp. 405-406, 420, and 423). In Pennsylvania, the number of slaves was always small and their entry often discouraged by high taxes. Donnan (cited above, vol. III, pp. 408-409) believes that data about the slave trade there must be sought in merchant's account books, newspaper advertisements, and items of ship news, some of which appear in Edward R. Turner, "The Negro in Pennsylvania," Prize Essays of American Historical Association, Washington, D.C., 1911. In New Jersey, the slave trade centered in the eastern part of the colony, but here too the number of slaves imported was relatively small.

## Z 133-145. Slave trade, by origin and destination, 1768-1772.

Source: Compiled by Lawrence A. Harper, University of California, from the American Inspector General's Ledgers of Imports and Exports, Public Records Office, London, Customs 16/1.

## Z 146-149. Slave trade in Virginia, 1619-1767.

Source: 1619-1699, Elizabeth Donnan, ed., Documents Illustrative of the History of the Slave Trade to America, Carnegie Institution of Washington, D.C., 1935, vol. IV, pp. 4-6, 49-65 (copyright), and Philip A. Bruce, Economic History of Virginia in the Seventeenth Century, vol. II, Macmillan, New York, 1895, pp. 66-85; 1700-1726, Donnan, Documents Illustrative . . ., vol. IV, pp. 173-187; 1727-1767, Donnan, vol. IV, pp. 187-234, and WPA compilations of colonial naval office lists (see general note for series Z 1-615).
The title of these series refers to "slaves" because that was the status of most Negroes listed, but it should be remembered that until the middle of the 17 th century Negroes came as servants, not as slaves. Unless otherwise noted, these figures show the total trade at all Virginia ports. When one or more quarters of a port's naval office lists are missing, the total for the full year has been estimated, the calculations resting upon a chronological or geographic extensionwhichever involved the least element of conjecture. The totals depend upon such estimates in all years after 1726 except 1737-1740, 1743-1745, 1750, 1758, 1761-1762, and 1764, when full records exist for all the ports except Accomack, which can be disregarded because of its lack of direct participation in the slave trade. No figure is given in which the total includes more than 20 percent estimate.
In the case of slaves exported, the highly variable nature of this trade did not warrant estimative totals. Of the slaves exported, 1,055 went to Maryland, 12 to North Carolina, 9 to Rhode Island, 8 and a shipment (number unspecified) to Barbados, 3 to Madeira, 2 to Great Britain, 2 to Georgia, and 1 to Boston.

## Z 150-154. Slave trade in New York, 1701-1764.

Source: 1701-1718, E. B. O'Callaghan, ed., Documents Relative to the Colonial History of the State of New York, vol. V, Weed, Parsons \& Co., Albany, 1855, p. 814; 1719-1764, Donnan, cited above for series Z 146-149, vol. III, pp. 462-509, and WPA compilations of colonial naval office lists (see general note for series Z 1-615).
Figures for New York for 1731 were partially estimated, for missing quarters, by Lawrence A. Harper, University of California. The estimates were derived by obtaining the ratio of the number of slaves imported for each quarter to the number annually imported. This ratio was based on figures covering a period of eight years in which quarterly data were available.

Figures for exports, 1701 to 1718 , are not available.

Z 155-164. Slaves imported into Charleston, S.C., by origin, 17061775.

Source: Compiled by W. Robert Higgins, Murray State University, Murray, Kentucky.

The number of slaves from each source was obtained, unless otherwise designated, from the "Shipping Returns," and "Duty Books ' $A$,' ' $B$,' and ' $C$.'.' The figures for 1717 to 1734 include all Negroes brought to South Carolina through the port of Charleston; for 1735 to 1775 , the recorded number was of Negroes imported for sale. The number of cargoes was determined from information given in the same sources. The total number of slaves imported came from the same sources except for 1706 through 1724, which came from a report in 1737 by a committee of the South Carolina assembly containing a record of slave importations published in London. The number of cargoes for this period are from Elizabeth Donnan, ed., Documents Illustrative of the History of the Slave Trade to America, vol. IV, p. 255.

The ports or locations from which the slaves were exported to Charleston are listed below:
From African ports-Anamaboe, Angola, Bance Island, Bonny, Calabar, Cape Coast, Cape Mount, Gambia, Gold Coast, Senegal, Sierra Leone, and Widah (Ouidah). By far the most frequent designation in the books was simply "Africa."
From Caribbean ports-Anguilla, Antigua, Bahamas (Providence), Barbados, Bermuda, Cuba (Havana, Oporto, Portola, Santa Cruz), Curacao, Dominica, Grenada and the Grenadines, Gaudeloupe, Haiti (including Cap Nicholas), Jamaica (including Spanish Town), Montserrat, Nevis, St. Christopher, St. Croix, St. Eustatius, St. Vincent, and Tobago.
From North American ports-Connecticut (New London), East Florida (St. Augustine), Georgia (Savannah), Massachusetts (Boston, Plymouth, and Salem), New Hampshire (Portsmouth), New York (New York city), North Carolina (Cape Fear), Pennsylvania (Philadelphia), Rhode Island, Virginia, and West Florida (Pensacola).
For further information see W. Robert Higgins, "The Geographical Origins of Negro Slaves in Colonial South Carolina," The South Atlantic Quarterly, vol. LXX, No. 1, Winter, 1971, or W. Robert Higgins, The Slave Trade of Colonial South Carolina, University of South Carolina Press, Columbia, South Carolina (forthcoming).

## Z 165-168. British-American and West African slave prices, 1638-

 42 to 1773-75.Source: Compiled by Richard N. Bean, University of Houston, from Richard N. Bean, The British Transatlantic Slave Trade, 16501775, unpublished Ph.D. dissertation, University of Washington, 1971, and Richard N. Bean, Additional Slave Prices, University of Houston, Department of Economics, Working Paper Series 741, No. 4, 1974.

Because of the scarcity of data, Bean included in his series almost every available observation on slave prices in order to get a continuous series. The numbers presented here were gleaned from such sources as commercial correspondence, government archives, published document collections, monographs, and occasionally undocumented citations in secondary sources. Some prices are for actual large scale transactions while others are simply estimates by informed contemporaries. Bean found no reasonable method to weight the observations according to their quality. Instead, he relied on the central limits theorem, operating through five-year averaging, to lessen the effect of the measurement errors. Since many of the price observations are averages for unspecified numbers of slaves, no attempt was made to weight the transaction prices by the number of slaves involved. British-American slave prices are adjusted to eliminate the effect of differential transport costs from Africa to places other than Jamaica.

Bean has suggested that anyone wishing to review his sources and methods of deriving these prices borrow copies of his unpublished Ph.D. dissertation and the working paper through inter-library loans from the universities cited.

## Z 169-191. Components of private wealth per free capita for the Thirteen Colonies, by region, 1774.

Source: Calculated by Alice Hanson Jones. See Jones' "Wealth Estimates for the American Middle Colonies, 1774," Economic Development and Cultural Change, vol. 18, no. 4, pt. 2, July 1970; "La fortune privée en Pennsylvanie, New Jersey, Delaware, 1774," Annales: Économies, Societes, Civilisations, vol. 24, no. 2, Paris, France, Armand Colin, Mars-Avril, 1969, pp. 235-249; "Wealth Estimates. for the New England Colonies about 1770," Journal of Economic History, vol. 32, no. 1, March 1972, pp. 98-127; Wealth of the Colonies on the Eve of the American Revolution, Columbia University Press, New York (forthcoming) and American Colonial Wealth: Documents and Methods, Arno Press, Inc., New York (forthcoming). Jerome Corn-
field gave guidance in drawing the sample in the pilot study for the Middle Colonies. Stephen E. Fienberg and F. Kinley Larntz, Jr., gave guidance in sample drawing for the other regions. Mr. Larntz guided the final execution of the sampling and development of the weighting procedures.

Wealth is estimated on the basis of a sample drawn from all estates probated in the Thirteen Colonies in 1774. To select the sample, every county then in existence was given a chance to be drawn proportionate to its total wealthholding population in 1774. Each county, or cluster of counties, drawn into the sample represents an equal stratum of living wealthholders. Wealthholders are defined to include all free adult males aged 21 and over, white and Negro, and 10 percent of all free adult females, chiefly widows, except no Negro females in the South. Slaves and indentured servants are not counted as wealthholders. Because of the sample design and weighting procedures followed, the combination of data from sample countries within a region yields an unbiased regional estimate of wealth of probated estates, and the regional estimates combined, except for the weakness of the New York data, yield an unbiased estimate for all Thirteen Colonies. The data for probated decedents are adjusted, through the weighting procedure, to the age structure of the living and to include an allowance for wealth of persons not probated, and hence to represent the larger statistical population of living wealthholders.
The counties included in the sample and numbers of probate cases for each are:
New England: Total 381. Connecticut: Litchfield 31, New Haven 37; Massachusetts: Essex 102, Hampshire 27, Plymouth 35, Suffolk 100, Worcester 49. Middle Colonies: Total 217. Pennsylvania: Northampton 21, Westmoreland 7, Philadelphia 135; New Jersey: Burlington 25; Delaware: Kent 29. South: Total 298. Maryland: Queen Anne 38, Anne Arundel 27; Virginia: Charlotte-Halifax 25, Southampton-Brunswick-Mecklenburg 23, Charlotte-Spotsylvania-Fairfax 30; North Carolina: Halifax 39, Orange 32; South Carolina: Charles Town District 87. In addition, 23 probate inventories from nine counties in New York, together with regional data for New England and Middle Colonies, serve to form an estimate for New York which is part of the Thirteen Colonies total but is not shown separately.
All the inventories probated in 1774 within the sampled counties or county-clusters are included, with a few exceptions. In Essex County, Massachusetts, there was a cut-off at 102 cases, taking all surnames alphabetically from A to part way through the P's. In several counties or county-clusters some cases randomly drawn from 1773 or 1775 were added to provide an adequate number of cases. In the then frontier county of Westmoreland, Pennsylvania, three cases for 1774, two for 1773, and two for 1775 are all that exist for those dates. For New York, the 23 cases used represent all the cases located that were probated in any year from 1772 through 1775 not only in the two sample counties of Suffolk and Albany but in any county in the province.

Data from each county or county-cluster received equal weight in its regional average, inasmuch as each represents an equal stratum of living wealthholders. The procedure means that the counties with larger numbers of cases do not dominate or bias their respective regional averages, yet that full use could be made of all the available cases. For the New York estimate, the 23 cases received 10 percent weight, the New England average 30 percent, and the Middle Colonies average 60 percent. The assumption here is that if more cases for New York had survived, they would have shown wealth resembling that found in the adjoining New England and Middle Colonies, somewhat more like the latter than the former. The Thirteen Colonies total gives each component regional average, including the estimate for New York, an importance in proportion to its 1774 living wealthholder population.

For all regions, data on portable physical wealth and on financial assets came from the probate inventories with occasional adjustments for data found in estate accounts. For New England, the inventories
are also the source of data on land. In the other regions, land was usually not shown in the inventories. For the Middle Colonies, original data on land come from tax lists and, for the South, from deeds and land grants. Data on financial liabilities for New England come from documents filed with probate inventories or from accounts of estate administrators or executors; in the other regions they came from the estate accounts.
Average wealth of the nonprobate-type living (persons who, upon death, would probably not have their estates probated) is assumed to equal one-fourth the average wealth of age-adjusted probated (i.e., probate-type living) in New York, the Middle Colonies, and the South, but one-half in New England. The larger figure is used for New England because a higher proportion of the wealthholders there were not probated. The numbers of living wealthholders (of either probate-type or nonprobate-type) is estimated as follows: Thirteen Colonies total 434,835; New England 137,934; New York 45,128; Middle Colonies 98,448 ; South 153,325 . The proportions of these wealthholders estimated to be of nonprobate-type are: New England 66 percent, New York 40, Middle Colonies 36, South 27.
The numbers of free capita used to construct this table, i.e., the total free population in 1774, men, women, and children, white and Negro, are estimated as follows: Thirteen Colonies total $1,820,019$; New England 582,285; New York 180,116; Middle Colonies 405,033; South 652,585 . These numbers are estimated to form the following proportions of the total population, free and nonfree: Thirteen Colonies total 77.3 percent; New England 95.8; New York 88.8; Middle Colonies 92.5; South 59.0. The total population figures were interpolated to 1774 on the basis of compound annual rates of population growth, separately for whites and for Negroes, from series Z 1-17 of the previous edition of this volume (U.S. Bureau of the Census, Historical Statistics of the United States: Colonial Times to 1957). The proportions of indentured whites and of free Negroes which underlie the figures on free population are estimated from secondary sources listed more fully in the first and last bibliography titles cited above. The underlying age structure of the living population, used for age adjustment from decedent to 1774 living wealthholders, is based on proportions of free whites in the 1800 census, modified slightly in the proportions of children. Complete population tables for 1774 will appear in Wealth of the Colonies, Columbia University Press, forthcoming.

Wealth figures in original documents were always stated in local pounds, shillings, and pence of the particular province, which were of varying values in relation to each other and to the English pound sterling. All local pounds have been reduced to equivalent pounds sterling, using as exchange rates the following numbers of local pounds and decimal equivalents thereof as equal to one pound sterling: Massachusetts and Connecticut 1.33; New York 1.79; Pennsylvania, New Jersey, and Delaware 1.70; Maryland common money 1.67, Maryland current money 1.33; Virginia 1.32; North Carolina 1.77; South Carolina 7.00.

## Z 192-194. Agriculture censuses in Maine, Massachusetts, and New

 Jersey, 1784.Source: Jedidiah Morse, American Geography, Boston, 1792, pp. 172 and 284.

It may be assumed that the limited information on agriculture presented in this table for Maine, Massachusetts, and New Jersey for 1784 was collected at the same time that the population was enumerated. Maine was a part of Massachusetts until it became a State in 1820. Other agricultural statistics of this type, except for a few estimates for parts of colonies, do not appear to exist for the colonial and pre-Federal period.

XXXI, pp. 186-187; before 1861 (majority of slaves), Kenneth Stampp, The Peculiar Institution, Alfred A. Knopf, New York, 1956, p. 282.

Data for calories per day, series Z 195, have been recalculated from those shown in Historical Statistics... Colonial Times to 1957 and rounded to the nearest 100 . Exact precision cannot be expected in reducing colonial data to modern caloric terms. Also, the totals might have been reduced before actual consumption by spoilage, human carelessness, and dishonesty, or increased by fish, game, and produce in season. Researchers interested in the subject should write to Professor Lawrence A. Harper, Department of History, University of California, Berkeley.

## Z 213-226. Value of exports to and imports from England by American Colonies and States, 1697-1791.

Source: 1697-1773, Charles Whitworth, State of the Trade of Great Britain in Its Imports and Exports Progressively from the Year 1697, G. Robinson, London, 1776; 1774-1776, David Macpherson, Annals of Commerce, Manufactures, Fisheries and Navigation, vol. III, Mundell \& Son, Edinburgh, 1805, pp. 564, 585, and 599; 1777-1791, compiled by Jacob M. Price, University of Michigan, from Public Record Office, London, B.T. $6 / 185 \mathrm{ff} .106 \mathrm{v}-117 \mathrm{v}$.
The English Inspector General's Ledgers (Public Records Office, London, Customs 2 and 3) provide the original source for these figures. Unfortunately, Whitworth's erroneous title has caused many to believe the figures relate to Britain rather than to England but otherwise his volume has much value. The source tables cover all countries and appear in two formats: One gives England's trade with any one country, annually; the other shows all the countries with which England traded each year. Those interested in studying broader trends will find value in the decennial averages in John, Lord Sheffield, Observations on the Commerce of the American States, 6ith edition, London, 1784. G. N. Clark's Guide to English Commercial Statistics, 1696-1782 (Royal Historical Society Guides and Handbooks, No. 1, London, 1938) provides a valuable history and analysis of the basic statistics and a useful appendix which has a chronological list of statistical material for 1663-1783 and specifies where the data may be found.

Users of this material should note the basis on which the values rest. Smuggling does not constitute a material factor during the years under consideration. However, other difficulties arise with respect to the question of the volume of exports and the value of all the trade. The repeal of the export duties on woolen manufactures in 1701 ( 11 W . III c 20) and of the remaining export duties in 1721 (Geo. II c 15) removed the penalty for false entries on exports, and some merchants overstated their quantity for reasons of real or fancied prestige-a practice which may have injected an element of error of about 4 percent (Clark, cited above, pp. 16, 27, and 35).
Another problem arose in determining the value of the merchandise imported as well as exported. The authorities of the early 18th century were greatly interested in the balance of trade and at first tried to ascertain the real commercial value of merchandise. However, the difficulties of doing so, and the increasing recognition that there were intangible elements which the records could not disclose, led to the abandonment of attempts to keep the values current by the end of the second decade of the 18th century.
The so-called "official values" became stereotyped between 1705 and 1721 (Clark, cited above, pp. 17-23), a fact which diminished their value for use in striking a balance of trade but increased their usefulness as a rough-and-ready index of the relative increase or decrease of the volume of trade.
This table has been revised from that published in the Historical Statistics . . ., Colonial Times to 1957 volume to include figures for the years 1777-1791. Also, several figures have been corrected, as indicated by footnote 1. The source for these corrections is: John J. McCusker, "The Current Value of English Exports, 1697 to 1800," William and Mary Quarterly, Third Series, vol. XXVIII, No. 4, October 1971, p. 612, footnote 8.
See also general note for series Z 1-615.

## Z 227-244. Value of exports to and imports from Scotland by American

 Colonies and States, 1740-1791.Source: Compiled by Jacob M. Price, University of Michigan, from records as follows: 1740-1773, House of Lords Record Office, London, 20 Nov. 1775; 1774-1791, Public Record Office, London, B.T., 6/185 ff.188v-204.

## Z 245-252. Value of exports to and imports from England by New

 York, 1751-1775.Source: Virginia D. Harrington, The New York Merchant on the Eve of the Revolution, Columbia University Press, New York, 1935, p. 354 (copyright).

Z 253-265. Tonnage capacity of ships, 1769 and 1770 , and value of exports and imports of American Colonies, 1769, by destination and origin.
Source: David Macpherson, cited above in source for series Z 213226, vol. III, pp. 571-572.

The tonnage figures shown are those used commercially-not those computed when the Royal Navy was purchasing vessels (see text for series Z 266-285). The statistics given by Macpherson are substantially the same as those given in Public Records Office, London, Customs $16 / 1$, except that Macpherson put the 1769 inwardbound tonnage data for Southern Europe in the West Indies column (and vice versa)-an error which has been corrected here.
The value figures for 1769 provide only a rough-and-ready index of the relationship among the different trades. Totals include figures for the Islands of Newfoundland, Bahama, and Bermuda (a factor which statistically makes only a minor difference). These data are based on the official valuations used in the customhouse which, according to Macpherson, considerably understate the true amount. This defect, however serious for some purposes, does not destroy the value of the figures for comparative purposes. Also, it must be remembered that the value figures exclude the intercolonial coastwise trade which the tonnage figures show to have been as large as any other.

See also series Z 213-226, which provide a broader and more representative base for studying the relative relationship of the Thirteen Colonies trade with England.

It should be noted that the use of these figures on volume of the traffic for the various trades for estimating the amount of shipping given full-time employment must allow for repeated voyages of the same vessel.

## Z 266-285. Number and tonnage capacity of ships outward and inward bound, to and from 5 cities, by destination and origin, 1714-1772.

Source: Compiled by Lawrence A. Harper, University of California, from photographic copies of the naval office lists in the British Public Records Office (C. O. 5), except for: 1714-1717, Boston, and 1715-18, New York City, E. B. O'Callaghen, ed., Documents Relative to the Colonial History of the State of New York, vol. V, Weed, Parsons, and Company, Albany, 1855, p. 618;1733 and 1734, Philadelphia, Pennsylvania Gazette for those years; 1752, Port Hampton, Francis C. Huntley, "The Seaborne Trade of Virginia in Mid-Eighteenth Century: Port Hampton," Virginia Magazine of History and Biography, vol. LIX, No. 3, July 1951, pp. 302-303; 1763 and 1764, New York, and 1765 and 1766, New York, Boston, and Philadelphia, see source for series Z 245-252, pp. 356-358; and 1768-1772, all ports, American Inspector General's Ledgers, Public Records Office, London, Customs 16/1.

Where the classification in Documents Relative to the Colonial History . . . did not correspond to that used here, the necessary adjustments were made by reference to the Colonial Naval Office lists (PRO C. O. 5).

The colonial naval officers appointed to enforce the English navigation laws as well as the collectors appointed by the English Commissioners of Customs under the act of 1673 (25 Car. II c 7) were charged with reporting the entry and clearance of ships as well as their cargoes. Many of the copies of the naval office lists have survived from the 18 th century. When they have not, records of the names and destinations of the ships (but not their tonnages) may be obtained from the shipping news in the colonial newspapers. Such data of entries and clearances provide the best rough-and-ready index of the course of trade and its relative volume.

Although the figures concerning the entry of goods such as molasses might be distorted by illicit trade, the severity of the penalty (forfeiture) for failure to enter one's ship and the difficulty of concealing the offense help to warrant the accuracy of ship entry figures. Tonnage figures, however, present a special problem. Ralph Davis in "Organization and Finance of the English Shipping Industry in the Late Seventeenth Century" (doctoral thesis, University of London, 1955) states (pp. 476-479) that the tornage as calculated when the English Navy was contracting for the purchase of a vessel was 25 to 33 percent greater than the conventional "tons burden" recorded in the customhouse books. Since the "tons burden" figures for the same ship remain constant in the passbooks and customs entries during the span of time here involved (although not necessarily for all periods), the difference between this purchase tonnage and the conventional tonnage will ordinarily not affect use of the data shown here.

See also general note for series Z 1-615.
Z 286-290. Value of commodity exports and imports, earnings, and value of slaves imported into British North American Colonies, 1768-1772.

Source: James F. Shepherd and Gary M. Walton, Shipping, Maritime Trade, and the Economic Development of Colonial North America, Cambridge University Press, London, 1972, table 1 (copyright).
The regions used are defined as follows: Northern Colonies-Newfoundland, Quebec, and Nova Scotia; New England-New Hampshire, Massachusetts, Rhode Island, and Connecticut; Middle ColoniesNew York, New Jersey, Pennsylvania, and Delaware; Upper SouthMaryland and Virginia; and Lower South-North Carolina, South

Carolina, and Georgia. Florida includes East and West Florida, and has been grouped with the Bahama and the Bermuda Islands principally because the overseas trade from these colonies was small relative to the other regions. The Northern Colonies are not listed under Africa because there was no trade between them.

The source for the commodity export and import data was the American Inspector-General's Ledgers (Great Britain, Public Records Office, Customs $16 / 1$ ) except that imports from Great Britain were taken from the English and Scottish customs records for these years (Great Britain, Public Records Office, Customs 3 and Customs 14, respectively). Price data were taken from various sources. Commodity exports are estimated f.o.b. values and commodity imports are estimated c.i.f. values. Shipping earnings include earnings from exports on colonial-owned ships plus earnings of colonial-owned ships carrying imports since the imports are valued c.i.f. Shipping earnings of colonial-owned ships carrying goods between foreign ports were estimated to have averaged 13,000 pounds sterling annually during 1768-1772. This estimate is included in the totals of shipping earnings, but not in the earnings estimated for the various routes between overseas areas and the colonies. These earnings are allocated to the total shipping earnings of each region as follows in pounds sterling: New England, 6,000; Middle Colonies, 3,000; and the Southern Colonies, 3,000 . ( 1,000 pounds sterling were lost in rounding.) Other invisible earnings include interest, insurance, and mercantile profits earned by colonial residents in their trade with overseas areas. Because of the likely small amounts involved, no estimates were made for Africa. The source contains a discussion of the problems and procedures of estimation and the validity of the estimates.

Other items which affected the colonial balance of payments but which are not reflected in the estimates are the sale of ships to overseas residents, the immigration of indentured servants, and expenditures by the British government for civil government and defense in the colonies. The source also presents a discussion of the probable magnitudes of these items.

Z 291-293. Average annual coastal exports, imports, and balances of trade, by region, 1768-1772.
Source: James F. Shepherd and Samuel H. Williamson, "The Coastal Trade of the British North American Colonies, 1768-1772," The Journal of Economic History, XXXII, 4, December 1972, p. 798 (copyright).
The estimates of values for coastal exports from, and imports into, each colonial port district are based upon quantity data taken from the American Inspector-General's Ledgers (Great Britain, Public Records Office, Customs 16/1), and price data taken from various sources. The computed values were then aggregated according to the regional definitions specified in the text for series Z 286-290. It is important to note that these are not net exports from, or net imports into, each region. Exports and imports that took place between ports within each region, as well as those to or from other regions, are included in each regional total. Total export and import values should be approximately the same; the discrepancy is due principally to discrepancies in quantities recorded in the customs records.
See source for a discussion of the procedures of estimation and the validity of the estimates.

Z 294. Value and quantity of articles exported from British Continental Colonies, by destination, 1770.
Source: David Macpherson, cited above in source for series Z 213-226, vol. III, pp. 572-573, supplemented by American Inspector General's Ledgers, Public Records Office, London, Customs 16/1.

Data do not include coastwise shipments as do the figures in the American Inspector General's Ledgers (PRO Customs 16/1). Macpherson (see source for series Z 213-226) states that he omitted fractional parts of the quantities but their value is retained in the value column. Because of this and an error which Macpherson saw but had no means of correcting, the value column may not be entirely
comparable with the quantity columns. The value figures are not the market values (which Macpherson believes to have been higher) but are the official customhouse values at the ports of exportation. Customs $16 / 1$ presents the quantities in all cases for a longer time span, 1768-1772, but the data there are not so conveniently totaled as in Macpherson.
See also general note for series Z 1-615.
Z 295-304. Coal exported from James River ports in Virginia, by destination, 1758-1765.
Source: Howard N. Eavenson, The First Century and a Quarter of American Coal Industry, Waverly Press, Inc., Baltimore, 1942, pp. 32-34, and WPA compilations (see general note for series Z 1-615) of naval office lists at the University of California.
These figures were compiled from the colonial naval office lists by Eavenson. They represent only the years for which records are complete in the case of both the Upper and Lower James. Comparison with the colonial exports for 1768-1772 (compiled by Eavenson, p. 36, from PRO Customs 16/1) shows that the James River shipments constituted the great bulk of the exports from the Thirteen Colonies. Out of a total of 2,798 net tons recorded, 1,220 net tons were shipped from the Upper James, 180 from the Lower James, 1,100 from Nova Scotia, 117 from New Hampshire, and only minor quantities from other ports (which may have been used as ballast and originally may have come from Great Britain).

Chaldrons were not converted into tons at the Newcastle rate of 5,936 pounds equal to 2.97 net tons but on the measure used after the Revolutionary War, a chaldron equaling 36 bushels or 1.44 net tons.

## Z 305-325. Coal imported, by American ports, 1768-1772.

Source: American Inspector General's Ledgers, Public Records Office, London, Customs 16/1.
Chaldrons and bushels were converted to net tons as described in text for series Z 295-304.

The WPA compilations (see general note for series Z 1-615) from the naval office lists show earlier entries of coal in the several ports, from time to time. The great bulk came from Britain, the remainder (except in the case of exports from James River ports) apparently were transshipments, but it is not until 1768 that records give a good cross section of the traffic.

## Z 326-417. General note.

Iron was listed in colonial commerce as "pig iron" which derived its name from the shape assumed by the molten iron when poured from the furnace, after being separated from the ore, and "bar iron" which consisted of malleable iron produced in bloomeries or at the forge. Iron manufactures not specifically described by name, such as anchors, axes, pots, nails, scythes, etc., were listed as "cast iron" if poured into forms and "wrought iron" if forged from malleable iron, except in the English Inspector General's records (PRO Customs 3) where the term "wrought iron" seems to have included both cast and malleable iron products.

The statistical picture of iron in the colonies can be reconstructed in part from data concerning iron works in the colonies and in part from the records of colonial trade. The beginning of this industry came early in the various American colonies: Virginia 1622, Massachusetts 1645, Connecticut 1657, New Jersey 1680, Maryland 1715, Pennsylvania 1716, and New York shortly before 1750. By 1775, the colonies had at least 82 charcoal furnaces which produced about 300 tons each, or a total of 24,600 tons, of pig iron and more than 175 iron forges, some being bloomeries which made bar iron directly from the ore. Most of them, however, were refinery forges which used pig iron. Each of the 175 forges produced an average of 150 tons of bar iron a year, or 26,250 tons in all. In addition, there were slitting mills and other iron works.

Arthur C. Bining, in British Regulation of the Colonial Iron Industry,
cited below for series Z $326-330$, p. 134, provides a table comparing American production with the world total (see text table I). These estimates include pig iron, cast iron wares made at blast furnaces, and bar iron produced at bloomeries directly from the ore.

Table I. Iron Production of American Colonies and the World [In tons]

| Year | ${ }_{\text {American }}^{\text {A }}$ Colonies | World |
| :---: | :---: | :---: |
| 1800 | 45,000 | 400,000 |
| 1790 | 38,000 | 325,000 |
| 1750 |  | 150,000 |
|  | 1,500 | 100,000 |

The figures shown in series Z 326-417 for the movement of the various types of iron in commerce throw light on England's efforts to encourage Americans to produce pig and bar iron by freeing those products from import duties in England, and to limit further manufacture by prohibiting the erection of any new slitting or rolling mills, tilt hammer forges, or steel furnaces ( 23 Geo . II c 29 ; 30 Geo . II c 16). Iron was not added to the list of enumerated products which could be shipped only to Britain (or another colony) until 1764 ( 4 Geo . III c 15), and even then the law only forbade shipments to Europe.

Comparisons of colonial production with export figures will help provide estimates of the home market, which can be reduced to an approximate per capita base by reference to series Z 1-19.

See also general note for series Z 1-615.

## Z 326-330. Pig iron exported to England, by colony, 1723-1776.

Source: 1723-1755, and series Z 326 only, 1761-1776, Arthur Cecil Bining, British Regulation of the Colonial Iron Industry, University of Pennsylvania Press, Philadelphia, 1933, pp. 126-133 (copyright); 1756-1760, and series Z 327-330, 1761-1776, English Inspector General's Ledgers, Public Records Office, London, Customs 3.

Basically, all the figures come from the Inspector General's accounts although Bining obtained his from House of Lords manuscript, No. 185, and Harry Scrivenor, Comprehensive History of the Iron Trade, Longman, Brown, Green, and Longmans, London, 1841.
J. L. Bishop, A History of American Manufactures . . ., cited below for series Z 348-353, p. 625, gives an earlier figure when he states that the first iron sent to England from America was from Nevis and St. Christopher, followed in 1718 by $31 / 3$ tons from Virginia and Maryland. Series Z 326 is that of Bining and, where possible, footnotes explain the reasons for differences between his totals and those of the extended figures. The customs records were stated in terms of tons, hundredweights, quarters, and pounds, but they have here been rounded to tons.

## Z 331-337. Pig iron exported from American Colonies, by destination

 and colony, 1768-1772.Source: American Inspector General's Ledgers, Public Records Office, London, Customs 16/1.

The difference in total exports given in series Z 331 for Great Britain and that in series Z 326 for England should reflect trade with Scotland except for the variation in terminal dates and the lapse of time required to cross the Atlantic. The trade, however, seems to have been minor. J. L. Bishop, A History of American Manufactures . . . cited below for series Z 348-353, p. 628, gives figures showing that the pig iron exported to Scotland totaled only 264 tons in the 10 years from 1739 to 1749 and 229 tons in the 6 years from 1750 to 1756.

No figures are available for pig iron imported from England by the colonies. Such imports were probably negligible.

## Z 338-347. Pig iron imported by American Colonies from other Continental Colonies, 1768-1772.

Source: See source for series Z 331-337.
In addition to the colonies shown, these series also cover New

Hampshire, New Jersey, Georgia, and Florida. However, these colonies imported no pig iron for 1768-1772.

Z 348-353. Bar iron imported from England by American Colonies, 1710-1750.
Source: 1710-1735, J. L. Bishop, A History of American Manufactures From 1608 to 1860, vol. I, Edward Young \& Co., Philadelphia, 1861, p. 629; 1750, English Inspector General's Ledgers, Public Records Office, London, Customs 3.

Shipments of bar iron from England to the Colonies declined sharply in the last quarter century before the Revolution. Figures are not available for 1736-1749 to determine when the decline first became evident.

Imports were relatively few after 1750. The English and American Inspector Generals' Ledgers show that New England imported 6 tons in 1764, and again in 1769, and 1,053 bars in 1773 . South Carolina imported 19 bars in 1770 and 3 hundredweight in 1773.

## Z 354-359. Bar iron exported to England, by colony, 1718-1776.

Source: 1718-1755, and series Z 354, 1761-1776, Bining, cited above for series Z $326-330$, pp. 128-133; 1756-1760, and series Z 355-359, 1761-1776, English Inspector General's Ledgers, Public Records Office, London, Customs 3.

The original sources show data in tons, hundredweights, quarters, and pounds, but they have here been rounded by Lawrence A. Harper (University of California) to the nearest ton.

The source indicates that no bar iron was exported during 17101717 and for years which have been omitted in these series.

Z 360-373. Bar iron imported by American Colonies from other Continental Colonies, 1768-1772.
Source: See source for series Z 331-337.
Z 374-383. Bar iron exported by American Colonies, by destination and colony, 1768-1772.
Source: See source for series Z 331-337.
The difference in total exports given in series Z 374 for Great Britain and those in series Z 354 for England should reflect exports to Scotland, except for the variation in terminal dates and the lapse of time required to cross the Atlantic. According to J. L. Bishop, these exports were minor-only 11 tons from 1739 to 1749 (see text for series Z 331-337).

Z 384-397. Cast iron imported and exported by American Colonies, by origin and destination, 1768-1772.
Source: See source for series Z 331-337.
Additional information may be obtained concerning imports from England in the English Inspector General's Ledgers (PRO Customs 3) and in the WPA compilations (see general note for series Z 1-615) of the colonial naval office lists. English exports to the Colonies list, in addition to the generic heading "cast iron," such items as ordnance, iron pots, melting pots, and Flemish iron pots. The WPA compilations show an active coastal trade in pots as well as a surprisingly large quantity of sugar pots and sugar molds going to Kingston, Jamaica, especially from Philadelphia.
The figures for 1769-1771 may include some shipments from Scotland but the amounts probably are negligible.
The source also indicates additional minor quantities of cast iron exported to Southern Europe, Wine Islands, and West Indies.

## Z 398-405. Wrought iron imported from England by American Colonies, 1710-1773.

Source: 1710-1735, Bishop, cited above for series Z 348-353, p. 629; 1750-1764, and 1773, English Inspector General's Ledgers,

Public Records Office, London, Customs 3; 1769-1771, see source for series Z 331-337.
The figures for 1769-1771 may include some shipments from Scotland but the amounts probably are negligible.

The American Inspector General's figures for 1768-1772 (PRO Customs 16/1) disclose no exports of wrought iron from the Colonies to England, but the figures do show some shipments to the West Indies.

Z 406-417. Selected iron products imported and exported by American Colonies, 1768-1772.
Source: See source for series Z 331-337.
Figures are probably underestimated since the items included may have been listed under more general designations. The colonists were not necessarily dependent upon importation but may have manufactured their own nails and other articles from bar iron which was either home-produced or imported.
Since colonial imports of axes and scythes came so predominantly from the other colonies, and steel and nails from Great Britain, no note has been taken of the negligible importations of these items from other sources.

Z 418-431. Value of furs exported to England by British Continental Colonies, 1700-1775.

Source: Murray G. Lawson, "Fur-A Study in English Mercantilism, 1700-1775," University of Toronto Studies, History and Economics Series, vol. IX, University of Toronto Press, Toronto, 1943, pp. 108-109 (copyright).
As pointed out in the source, the fur trade is inextricably interwoven with the manufacture of beaver hats. Thus, the Hat Act of 1732 ( 5 Geo. II c 22) forbidding the exportation of hats by any colony, combined with the enumeration of beaver skins and furs in 1722 ( 8 Geo. I c 15), sought to protect the English hat manufacturers. These series show the importance to the English of their colonial supply of fur. Comparison of these figures with those shown in series Z 213-226 will demonstrate the relative unimportance of fur in the colonial balance of trade.

The source also specifies the different kinds and quantity of fur England imported from the colonies and elsewhere, as well as the quantity and value of the different markets of the world-data given in even greater detail in the original tables which Lawson has left with the WPA compilations at the University of California in Berkeley.
See also general note for series Z 1-615.

## Z 432-435. Indigo and silk exported from South Carolina and Georgia, 1747-1788.

Source: Series Z 432-434, 1747-1775, Lewis C. Gray, History of Agriculture in the Southern United States to 1860, vol. II, Carnegie Institution of Washington, D.C., 1933, p. 1024 (copyright), (except 1766, WPA compilations of colonial naval office lists, Public Records Office, London, C. O. 5; and 1768-1772, photographic copies of the American Inspector General's Ledgers, Public Records Office, London, Customs 16/1); 1783-1788, compiled by Jacob M. Price, University of Michigan, from records of the Public Record Office, London B.T. 6/21 ff.311-312. Series Z 435, Lewis C. Gray, cited above, vol. I, p. 187. See also general note for series Z 1-615.
The data on indigo are reasonably complete. Although South Carolina contemplated the production of indigo as early as 1672 , little came of it, presumably because of the competition from the British West Indies. When the British Islands began to emphasize sugar rather than indigo, England had to depend upon the French West Indies for her supplies of indigo until South Carolina (thanks to the enterprise of Eliza Lucas) again entered the field. The first successful crop in 1744 was largely devoted to seed but South Carolina
was soon exporting in quantity. In due course, Georgia became a competitor but British Florida did not enter the picture until late. Even during the last 5 years of the colonial period, British Florida's production ranged only between 20,000 and 60,000 pounds (Gray, cited above, vol. I, pp. 54 and 291-295).

The great bulk of indigo went to Britain (which wanted it as a source of blue dye), not only because of its enumeration in the act of 1660 (12 Charles II c 18), but also because of the bounty England paid of 6 pence per pound ( 21 Charles II c 30). However, Customs $16 / 1$ and the WPA compilations (see general note for series Z 1-615) show that minor quantities went to other Continental Colonies. Gray's Carolina figures, which were taken by him from an English source, apparently do not include coastwise shipments. This omission is relatively unimportant since the coastwise figures for 1768-1773 (as shown in Customs 16/1) represented only 1.6 percent of the total exports. The figures for Georgia (compiled by an American customs official) include shipments coastwise as well as to England-a matter of statistical significance as they constituted 5.1 percent of Georgia's total for 1768-1773.

Comparison of Gray's figures for 1747-1765 with those for 17681773 in Customs $16 / 1$ suggests that Gray's figures are not for Charleston and Savannah alone, as shown by his headings, but for South Carolina and Georgia. In the case of South Carolina, the two series agree exactly in 1768 , the one year when we have figures from both sources. Since Gray's source (British Museum, Kings Manuscripts, 206, f. 29) is the same for the earlier years, 1747-1765, it seems probable that the figures for these years also refer to South Carolina as a whole.

Customs $16 / 1$ does not conclusively answer the problem in the case of Savannah. It shows for 1768-1772 that Savannah was the only Georgia port exporting indigo except in 1772. For this year, Gray's figures differ slightly from those shown in Customs 16/1 for Savannah alone and also those for Georgia as a whole. The decision to change the heading from Savannah to Georgia rests upon the fact that Bernard Romans (A Concise Natural History of East and West Florida, vol. I, New York, 1775, p. 104) specifies Georgia rather than Savannah.

Whether or not the figures are for Savannah or Georgia seems statistically insignificant. In South Carolina, however, ports other than Charleston provided 7.8 percent of that colony's exports to England for 1768-1773. Whatever may be true of Gray's figures, those given for 1768-1773 from Customs $16 / 1$ do include all South Carolina ports and all of Georgia, but the only figure available for South Carolina for 1766 (from the WPA compilations) is for Charleston alone.

The figures on silk are from records compiled by the Georgia Comptroller of Customs (Gray, cited above, vol. I, p. 187). See also text for series Z 436-440.

## Z 436-440. Silk exported and imported by North and South Carolina, 1731-1755.

Source: Chapman J. Milling, ed., Colonial South Carolina, University of South Carolina Press, Columbia, 1951, p. 104 (copyright).

Despite vigorous efforts to encourage colonial silk production by both British and colonial governments, more silk moved west than east across the Atlantic. Early figures gathered by Gray (cited above for series Z 432-435, vol. I, pp. 184-187) show that in 1654 Virginia reported the production of only 8 pounds; in 1656,10 pounds (wound silk); in 1668, 300 pounds (sent to Charles II, type unspecified); in 1730,300 pounds (raw), and that the Carolinas sent "several bales" to London in 1710 and again in 1716. Georgia's first efforts succeeded in sending only 20 pounds of silk to England in 1739 . In 1741, she produced 600 pounds of cocoons (of which 16 pounds made 1 pound of silk) as against 37 pounds of wound silk in all the previous years of the colony. In 1749, the Salzburgers (a religious colony of industrious peasants and artisans) alone produced 762 pounds of cocoons and 50 pounds, 13 ounces, of spun silk. In 1764, the Colonies'
total product amounted to 15,212 pounds of cocoons. See also text for series Z 432-435.

The figures for the Carolinas (1731-1755) were taken from British records and appear in Governor James Glen's Description of South Carolina (Milling, cited above, p. 104).

## Z 441-472. General note.

Colonial statistics concerning production and consumption of tobacco have not been developed yet, and perhaps they can never advance beyond the rough estimate stage. For the present, only general deductions from export statistics and other evidence can be made.
Figures for trans-Atlantic shipments of tobacco in the 17 th century leave much to be desired (see text for series $\mathrm{Z} 457-459$ ) but those for the 18 th century are reasonably satisfactory. The 18 th century statistics of English imports rest upon contemporary compilations from customhouse entries. The figures for Scotland are less exact and in the early years they do not rise above mere estimates. However, Scotland's tobacco imports were relatively minor in those years. Fortunately, as their relative importance grew, the Scottish statistics became more reliable.
British imports represented virtually all the colonial exports. The figures given in series Z 441-448 and Z 449-456 give the landed weight in Britain. Due to the tobacco's loss of moisture while crossing the Atlantic, the landed weight in Britain is about 5 percent less than the shipping weight in America (Arthur P. Middleton, Tobacco Coast, the Mariners' Museum, Newport News, Va., 1953, p. 104; Rupert C. Jarvis, Customs Letter-Books of the Port of Liverpool, 1711-1813, the Chetham Society, Manchester, 1954).

Unfortunately, the English Inspector General's Ledgers of Imports and Exports (PRO Customs 3) do not differentiate between shipments from Virginia and Maryland as do the Scottish (PRO Customs 14) and the American (PRO Customs 16/1).

The validity of British statistics as a reflection of the American tobacco trade depends, of course, upon colonial obedience to the regulations requiring shipment (with minor exceptions) of colonial tobacco to England (Britain after 1707)-at first by royal order and after 1660 by the Navigation Act of 12 Car. II, c 18.

Until the English drove the Dutch from New Netherland (first in 1664 and finally in 1674) great opportunities existed for illicit trade in America. The rules also appear not to have been consistently enforced in Europe (see text for series Z 457-459). In the 1680's there was a flareup of illegal shipments to Ireland but it reflected a sudden change in the law. The offending vessels were apprehended and the great bulk of the Irish trade thereafter seems to have followed legal channels. There were lurid accounts of smuggling to Scotland at the turn of the century but the quantity of tobacco involved should be viewed in proportion to the trade as a whole. One cannot reasonably expect the illegal shipments at that time to exceed the shipments made a decade later with full sanction of the law. In fact, the illegal shipments presumably were much less because Scotland as a whole at the end of the 17th century had only one-fourth of the shipping it had within 5 years after direct trade was permitted. The Clyde ports, which were most concerned with the American trade, had only one-tenth of their later shipping (L. A. Harper, The English Navigation Laws, Columbia University Press, New York, 1939, pp. 260-261). In view of this difference in the shipping available, the volume of illegal trade would seem not to have been more than 250,000 pounds, and a comparison with series $Z 441-448$ shows that it represented at most 1 percent of the tobacco crossing the Atlantic lawfully.

During the 18 th century there was undoubtedly some smuggling of tobacco but it does not seem likely to impair the validity of the colonial import statistics. The illicit trader's greatest profit did not lie in evading the provisions of the Navigation Act but in escaping the high taxes laid on tobacco in England. The most effective technique consisted in importing the tobacco and reexporting it legally to a nearby port (such as the Isle of Man) whence small craft could
"run" it ashore again duty-free (for details, see Jacob M. Price, The Tobacco Trade and the Treasury, 1685-1733: British Mercantilism in its Fiscal Aspects, unpublished doctoral dissertation, Harvard University, 1954).
American historians have pointed to the small amount of the "plantation duties" collected on intercolonial trade as evidence of the breakdown of the laws. If the American colonists consumed the 5 pounds per capita of the Bermudians in the early 18th century, the 2 pounds of the English at the beginning of the 18th century, or even their 1 pound per capita at the end of the 18 th century (Alfred Rive, "The Consumption of Tobacco Since 1600," Economic Journal Supplement, Economic History Series, vol. I, Jan. 1926, p. 63; H. C. Wilkinson, Bermuda in the Old Empire, Oxford University Press, London, 1950, p. 14), the colonies would have provided a sizable market of $2,000,000$ to $10,000,000$ pounds at the time of the Revolution. But that is a figure which can and must be greatly discounted. In the first place, it should be cut in half because the Southern Colonies had about half the population and provided their own source of supply. Similarly, allowance must be made for tobacco produced in the Northern colonies. Pennsylvania, Delaware, New York, Rhode Island, Connecticut, and Massachusetts all at one time or another grew tobacco (George L. Beer, The Origins of the British Colonial System, 1578-1660, Macmillan, New York, 1908, p. 88; J. B. Killebrew, Report on the Culture and Curing of Tobacco in the United States, Department of the Interior, Census Office, Washington, D.C., 1884, pp. 147 and 237; Vertrees J. Wyckoff, Tobacco Regulation in Colonial Maryland, Johns Hopkins University Studies in Historical and Political Science, Extra Volumes, New Series, No. 22, Baltimore, 1936, pp. 37, 38, and 65). Philadelphia, Lewes, and New Castle appear in the WPA compilations (see general note for series Z 1-615) as suppliers to other ports like New York and Boston. New York itself exported tobacco (and even more snuff) coastwise as well as to England, and the exports from New England continued large even into the 1750 's. In the 1760 's, Rhode Island tobacco crops provided surpluses sufficient to warrant shipping 200,000 pounds to Surinam, a colony in South America (James B. Hedges, The Browns of Providence Plantations, Harvard University Press, Cambridge, 1952, pp. 30-40).

It need not be assumed that the colonists were averse to violating the law. It may be that violations on a significant scale were not good business. The fact that the 200,000 pounds of Rhode Island tobacco sent to Surinam went there illegally means little. It was a type of tobacco not in general demand and constituted less than onethird of one percent of the annual legal trade.

## Z 441-448. Tobacco imported by England, by origin, 1697-1775.

Source: Compiled by Jacob M. Price, University of Michigan.
The basic sources used by Price are the same as those used by him for his doctoral dissertation (see below).

The English Inspector General's Ledgers (PRO Customs 3), which are the original source of the data, distinguish between entries in London and in the rest of the Kingdom (the outports) but Price has combined them in the interest of saving space.

## Z 449-456. American tobacco imported and reexported by Great Britain, 1697-1791.

Source: 1697-1775, Jacob M. Price, The Tobacco Trade and the Treasury, 1685-173s: British Mercantilism in its Fiscal Aspects, unpublished doctoral dissertation, Harvard University, 1954; 17831791, compiled by Jacob M. Price, University of Michigan.
The basic sources of the data for England in Price's doctoral dissertation were the Inspector General's Ledgers of Imports and Exports (PRO Customs 2 and 3) except as follows (see general note for series Z 1-615 for an explanation of the call numbers which follow): 17031722, from PRO CO 390/5/47; 1717-1722, confirmed in PRO T. $1 / 281 / 18$, BM Add. MS. 33,038 fol. 159; 1722 (London import only), from PRO T 64/276B/327; 1763-1769 (import only), from PRO T. 64/276B/328; 1770-1773 (import only), from PRO T. 64/276B/

332; 1770-1771 (export), from PRO T. 64/276/330; 1772, 1774-1775 (import and export), from PRO T. 17/1,3,4; 1773-1775 (export), from Adam Anderson, An Historical and Chronological Deduction of the Origin of Commerce, vol. IV, J. Walter, London, 1707-1709, p. 447; 1783-1791, PRO Customs 17/8-14.
For Scotland, Price's data came from the Scottish Ledgers of Imports and Exports (PRO Customs 14), except as follows: 1707-1711 (import and export), from PRO T. 1/39/29; 1715-1717 (import and export), from PRO CO 390/5/13; 1721-1724 (import and export), from PRO T. 1/282/23; 1725-1731, 1752-1754, 1763, 1769 (import and export), from PRO T. 36/13; 1738-1747 (import and export), from PRO T. 1/329 fol. 125.
Total imports and reexports for 1708-1731 and 1752-1754 were obtained by adding figures not strictly comparable with each other. Scottish imports and reexports for 1708-1717 are averages of estimates for several years.

## Z 457-459. American tobacco imported by England, 1616-1695.

Source: 1616-1621, Vertrees J. Wyckoff, Tobacco Regulation in Colonial Maryland, Johns Hopkins University Studies in Historical and Political Science, Extra Volumes, New Series, No. 22, Baltimore, 1936, pp. 20-36 (copyright); 1622-1631, Neville Williams, "England's Tobacco Trade in the Reign of Charles I," The Virginia Magazine of History and Biography, October 1957, pp. 403-449, Virginia Historical Society, Richmond (copyright); 1637-1640, Stanley Gray and V. J. Wyckoff, "The International Tobacco Trade in the Seventeenth Century," Southern Economic Journal, VII, July 1940, pp. 18-25, University of North Carolina, Chapel Hill (copyright); 1663-1695, compiled by J. M. Price from PRO CO 388/2 ff.7,13 (1663, 1669), outports for 1669 from Lonsdale MS, B. M. Sloane MS. $1815 \mathrm{ff} .34-7$ (1683-1689), PRO T. 1/36/9 fo.50 (1689-1693), and Gray and Wyckoff, cited above (1672-1682); 1693-1695, House of Lords Record Office, parchment collection.
The figures here are not as satisfactory as those given in series Z 441-448 and Z 449-456. The total imports for 1686 and 1688 were obtained by adding figures not strictly comparable with each other. Imports of the outports (English ports other than London) for $1682-1688$ are averages of estimates for several years. In a few instances the figures from Gray and Wyckoff include minor quantities of Spanish and Brazilian tobacco.
As indicated in the general note for series $Z 441-472$, the figures shown prior to the time when the Dutch were driven from New Netherland should not be relied upon too greatly. Rive (cited in source above, pp. 57-75) suggests that the doubling of the London import figures between 1637 and 1638 may have been due to better patrolling of the Channel. There is much evidence to show that the laws restricting tobacco importations to London and excluding Spanish tobacco were disregarded at least in part (Beer, cited above in general note for series Z 441-472, pp. 197 ff.; Williams, cited in source above, pp. 419-420; Wyckoff, cited in source above, pp. 32-34).

An alternate approach to studying the import figures is to consider the estimates of tobacco which might be produced or purchased. English proposals for limitations on tobacco importation included the following: 55,000 pounds in $1620 ; 200,000$ pounds in 1625 and 1626; 250,000 pounds in 1627; 600,000 pounds in 1635; and 1,600,000 pounds in 1638 (Beer, cited above in general note for series Z 441472 , pp. 120, 138, 154, and 158). Virginia meantime wanted the King in 1628 to take at least 500,000 pounds annually and by 1639 sought to reduce the tobacco crop to $1,500,000$ that year and $1,300,000$ pounds for each of the next two years (Killebrew, cited above in general note for series Z 441-472, pp. 215-216).
Another weakness of the figures for these series lies in their failure to show which colonies supplied the tobacco; however, other data provide some opportunities to estimate the quantity which the various colonies contributed. Virginia and Bermuda ran neck and neck in 1620 at 50,000 to 55,000 pounds each. In 1628 , Virginia's shipments were twice those of Bermuda, and thereafter Virginia drew far ahead (Beer, cited above in general note for series Z 441-472, p. 120; and

Williams, cited in source above, pp. 421-449). Her production had risen from 20,000 pounds in 1619 and went on to $18,150,000$ in 1688 and $18,295,000$ pounds in 1704 (R. A. Brock, "A Succinct Account of Tobacco in Virginia, 1607-1790," in J. B. Killebrew, cited above in general note for series $\mathrm{Z} 441-472$, p. 224). Bermuda's production increased to 500,000 pounds at the most in the 1680 's (George $L$. Beer, The Old Colonial System, 1660-1754, vol. II, Macmillan, New York, 1912, p. 91). At the end of the century, Bermuda's exports to England became negligible, and by the first quarter of the 18 th century Bermuda was importing from Virginia some of the 20,000 pounds consumed by her population, which was estimated at 3,600 whites and 5,000 slaves in the 1680 's (H. C. Wilkinson, Bermuda in the Old Empire, Oxford University Press, London, 1950, p. 14).

The West Indies were said to have begun growing tobacco as early as 1625 ; by 1628 , reports show the shipment of about 100,000 pounds, but by the middle of the century sugar began to take over as the predominant crop (Beer, The Origins . .., cited above in general note for series Z 441-472, pp. 89-90).

Meanwhile Maryland, which probably had produced no more than 100,000 pounds annually by 1639 (Wyckoff, cited in source above, p. 49), so increased her output that she contributed about 36 percent of the combined Virginia-Maryland total in 1688-a percentage she approximated at the turn of the 17th century (Margaret Shove Morriss, Colonial Trade of Maryland, 1689-1715, Johns Hopkins University Studies in Historical and Political Science, Series XXXII, No. 3, Baltimore, 1914, pp. 31-36) and during the period 1768 to 1773 (see series Z 467-468).

In the Colonies further south, North Carolina was said to be growing about 2,000 hogsheads, or $1,000,000$ pounds, of tobacco in the 1670's-an estimate which seems more generous than the subsequent pattern of exports justifies (Beer, The Old Colonial System, 1660-1754, cited above, vol. II, p. 195).

## Z 460-472. American tobacco exported and imported, by origin and destination, 1768-1772.

Source: Compiled by Lawrence A. Harper, University of California, from American Inspector General's Ledger of Imports and Exports, Public Records Office, London, Customs 16/1.

Although they cover only a few years, these series provide the only known comprehensive data which permit a complete analysis of the pre-Revolutionary colonial tobacco trade.

In the source, some export figures for 1768 and 1770 for Virginia, North Carolina, and South Carolina were shown in hogsheads or barrels. When the weights of these units were not indicated, they were converted to pounds by Harper, by using the average weights of these units as reflected in the shipments to Great Britain from the respective colonies for 1768-1772.

Also, the source shows the South Carolina export to Great Britain for 1771 as 433 hogsheads totaling 40,333 pounds. This obviously is an erroneous ratio. Since the hogshead figure is more comparable to other data shown here than the pounds figure, the former is assumed to be correct. It has been converted to pounds in the same manner as the 1770 export figures mentioned above.

## Z 473-480. Tea imported from England by American Colonies, 17611775.

Source: Compiled by Lawrence A. Harper, University of California, from the English Inspector General's Ledgers, Public Records Office, London, Customs 3.

Figures for tea imports shown in the American Inspector General's Ledgers (PRO Customs 16/1) for 1768-1772 closely approximate those shown here for the corresponding years (O. M. Dickerson, The Navigation Acts and the American Revolution, University of Pennsylvania Press, Philadelphia, 1951, pp. 99-100).

## Z 481-499. General note.

Information on rice in the colonial period is limited primarily to
the material on the clean rice which entered commercial trading. Presumably, the weight of this rice bore approximately the same ratio to the rough rice of the plantation at that time as it does now, that is, $100 / 162$. There are no known satisfactory statistics on rice production and only scattered data concerning domestic consumption. Lord Carteret told the Board of Trade in 1715 that South Carolina "spent in the country" one-third of the 3,000 tons of rice she was producing at that time. By the pre-Revolutionary period, comparison of total exports with net imports for 1769-1772 indicates that only 3 percent of total exports was consumed in the nonriceproducing colonies.

The basic sources of statistics on clean rice in commerce are the records of importations in the British Public Records Office kept by the English Inspector General of Imports and Exports (Customs 2 and 3, since 1696), by the Scottish Inspector General (Customs 14, since 1755), by the American Inspector General (Customs 16/1, 1768-1772), and the records kept by the colonial naval officers (supplemented by those kept by the deputies of the London Commissioners of Customs for the comparatively few instances when these records have survived).

Data from these basic sources appear in: Gray, History of Agriculture . .., cited above for series Z 432-435, pp. 1020-1023; Francis Yonge, A View of the Trade of South Carolina, London, 1722; C. J. Gayle, "The Nature and Volume of Exports From Charleston, 17241774," The Proceedings of the South Carolina Historical Association, Columbia, 1937, pp, 30-31; G. K. Holmes, Rice Crop of the United States, 1712-1911 (Circular 34, Department of Agriculture, Bureau of Statistics, 1912); Francis Yonge, Narratives of the Proceedings of the People of South Carolina, in B. R. Carroll, Historical Collections of South Carolina, vol. II, Harper \& Bros., New York, 1836, p. 156; The Case of the Province of South Carolina (Carroll, vol. II, p. 265); Gov. James Glen, Description of South Carolina (Carroll, vol. II, p. 26); "An Account of Sundry Goods Imported and . . . Exported . . . From the First of November 1738 to the First of November 1739" (printed as a broadside by P. Timothy, Charleston, 1739), Bernard Romans, Natural History of East and West Florida, New York, 1775; and WPA compilations from the Charleston Naval Office lists (see general note for series Z 1-615).

Fortunately, the British records measure the quantities imported in hundredweights, but the American statistics usually give only the number of barrels and other containers exported. Where half-barrels were reported, the number was divided by two and the result included in the barrel totals.

Miscellaneous units in the American figures have been converted to barrels. The term "cask" has been considered synonymous with "barrel," following the usage of the American Inspector General's Accounts for 1768 , but the remaining figures are rough approximations suggested by the weights of other commodities as given in M. Postlethwayt, The Universal Dictionary of Trade and Commerce, W. Strahan, London, 1774; J. H. Alexander, Universal Dictionary of Weights and Measures, D. Van Nostrand, New York, 1867, and the Oxford English Dictionary. A tierce has been considered to equal $11 / 3$ barrels; a hogshead, 2 barrels; a puncheon, $22 / 3$ barrels; a butt, 4 barrels; small barrels and small casks, $1 / 2$ of a barrel; seroons, boxes, and bags, 25 of a barrel; kegs, $1 / 5$; and bushels, $1 / 8$. Colonial containers varied so greatly that these estimates seldom, if ever, represented the exact relationship. When discussing weights and measures for other uses, additional information should be obtained and corrections, as may be necessary, should be made in the formulas employed here. For present purposes, these maverick units constitute such a negligible part of the whole that errors in estimating their weight seem unlikely. to exceed those involved in rounding.

The significant problem lies in determining the weight of the barrel, the principal unit. Holmes (cited above, p. 4) stated that it weighed 350 pounds in 1717; 400 pounds, 1718-1729; and 500 pounds, 17301788, but as Gray (cited above, vol. II, p. 1020) points out, these figures conflict with those given by others. Although Governor Johnson of South Carolina stated in 1719 that the average barrel
contained about 350 pounds, Francis Yonge, the collector at Charleston, gave the figure of 400 pounds for 1719-1721; a Savannah Rice Association study declared it to be 325 pounds for $1720-1729$; a contemporary report in 1731 and Governor Glen of South Carolina in 1749 said the barrel contained 500 pounds, but other documents say that it was $500-600$ pounds in 1763; "something over 600 pounds in 1768-1769"; 550 pounds for $1764-1772$; and 540 pounds net in 1772. O. M. Dickerson, The Navigation Acts and the American Revolution (cited above in text for series Z $473-480$, p. 59) states that the formula used by the customs service for converting barrels to hundredweight had each barrel containing $4 \frac{1}{2}$ hundredweight, or 504 pounds (but the records do not disclose when the formula was calculated nor how often it was revised).

Fortunately, an examination of the surviving official statistics enables one to obtain averages calculated on broad bases. The decennial totals for $1720-1729$ and 1730-1739 (Gov. James Glen, cited above) give both the number of barrels and the total weight shipped, showing the average barrel to weigh 373 pounds during the first decade and 448 pounds during the second. Similarly, the naval office lists for 1756-1767, which record both the number of barrels and pound weights shipped to Southern Europe and the West Indies, give a weighted average of about 525 pounds each for some 20,000 barrels.

Comparisons of the number of barrels shipped to Britain from America with the weight recorded for the rice arriving there provide another means of estimating the average weight of the rice barrel. For present purposes, it can be assumed to have been 350 pounds until 1720 , and then to have risen 10 pounds a year until 1730 , when it remained at a plateau of 450 pounds until after 1740; then it began to ascend at the rate of 5 pounds a year until it reached its pre-Revolutionary peak of 525 pounds in 1755 . It must be remembered, however, that the weight of the barrels might vary radically. New York's Naval Office list for 1764 shows one shipment averaging 1831/2 pounds a barrel and another 698 pounds.

## Z 481-485. Rice exported from producing areas, 1698-1789.

Source: 1698-1774, compiled by Lawrence A. Harper, University of California, from references discussed below; 1783-1789, compiled by Jacob M. Price, University of Michigan.

These series attempt to provide a comprehensive statistical summary comparable to those available for the postcolonial period. Barrels have been converted to pounds on the bases described in the general note for series Z 481-499.
There was the problem of totaling the exports from the three South Carolina ports (Charleston, Beaufort-Port Royal, and GeorgetownWynyaw) and those of Georgia. Shipments from other colonies can be considered as having originated in South Carolina and Georgia, except possibly those of North Carolina, and even in this case most of the exports probably went through South Carolina. In any event, North Carolina's exports are grouped with South Carolina's shipments in the English import figures, under the generic heading, "Carolinas." Shipments to Scotland seem to have been infrequent and insignificant until the French and Indian War (1754-1763).
The Charleston figures, with the exceptions noted below, are those compiled by Gayle (cited above in general note for series Z 481-499) from the South Carolina Gazette, although his figures for less than 12 months have been extended to full year bases for $1750,1756,1757$, 1763, and 1767. For 1698-1724, the figures have been calculated on the assumption that all American rice imports recorded in the English Inspector General's Ledgers were equal to $7 / 8$ of Charleston's total exports, as suggested in 1719 by Francis Yonge, the customs collector at Charleston, a conclusion corroborated by a comparison of the WPA compilations of Charleston exports with the English imports for 1717, 1718, 1719, and 1724, and by Edward Randolph's remark in 1700 that 110 of Charleston's exports went to the West Indies alone (Carroll, cited above in general note for series Z 481499). For 1731, the figures come from the WPA compilations of the Charleston Naval Office list (see general note for series Z 1-615), and
for 1734 and 1758, directly from the South Carolina Gazette; for 1765, from the Charleston Year Book (1880) as copied by Holmes (cited above in general note for series Z 481-499); for 1766, from photographic copies of the Charleston Naval Office list (PRO C. O. 5); for 1768-1772, from the American Inspector General's Ledgers (PRO Customs 16/1); for 1773 and 1774, from Gray (cited above for series Z 432-435, p. 1022), although his partial figure for 1773 has been extended to complete the year. The years terminate October 31 except 1698 (September 28); 1699-1724, 1731 (December 24); and 1768-1773 (January 4 of the following year).

Neither Beaufort-Port Royal nor Georgetown-Wynyaw (South Carolina) seem to have had much importance until 1732. Although the former had its first collector in 1729, there was a lapse of 232 years before his successor took over (PRO AO 1/804/1038, A0 1/805/ 1039); and the latter appears to have had its first collector in June 1732 (South Carolina Gazette, June 24, 1732). Scattered naval office records show Georgetown exporting 385 barrels for the year 1734 and 509 for the first quarter in 1735; and Beaufort, 342 during the first half of 1736. In 1739, Georgetown exported 2,202 barrels and Beaufort, 2,165 barrels (broadside, cited above, general note for series Z 481-499), an approximate equality which also existed in the period 1768-1772 (PRO Customs 16/1). For lack of a better basis, their exports will be considered for present purposes to have been equal from 1733 to 1768 , when exact figures are available and were used. In 1739, the exports of the two together equalled 61/2 percent of South Carolina's exports-a percentage which dropped by 17691772 to 4.4 percent. Thus, from 1739 to 1768, the Beaufort and Georgetown contributions have been assumed to be 5 percent of the total South Carolina exports. A different formula was used for the years prior to 1739, when their percentage was growing from the $21 / 2$ percent which they enjoyed in 1734 (calculated by doubling the Georgetown figures which have survived for that year). On the necessarily arbitrary assumption that the rate of increase was uniform, the two ports each year from 1734 to 1739 added 0.7 percent to their share of South Carolina's exports. Extending the same formula backwards, their share of the Carolina total was 1.8 percent in 1733 and 1.1 percent in 1732.

Romans, cited above, general note for series Z 481-499, provides figures for Georgia for 1756-1767. A comparison of his figures for Georgia's total exports with those of receipts from Georgia in England (see series Z 493-499) for the decade 1756-1765 shows a ratio of one barrel exported for every 2.07 hundredweight received; and for 1740 , 1742,1750 , and 1753-1755, the barrels shipped from Georgia have been computed in accordance with that formula, on the basis of English receipts (series Z 493-499). Figures for 1768-1772 come from PRO Customs 16/1. In 1773 and 1774, Georgia is assumed to have contributed 13.9 percent of the total exports, as it did from 1768 to 1772 . Years end January 4 of the year following, except for the years for which figures are calculated, as noted above. For those years, no exact date can be assigned and the data are therefore not strictly comparable.

The figures for $1768-1772$ provide the best basis for the later period, but for present purposes the 1768 list was not included in the basic calculations described above because it lacks data for coastwise exports; however, it provides the best base for estimating the imports for that year. All that need be assumed is that the ratio of the coastwise exports to the other exports was the same in 1768 as the average of the other four years.
The coastwise entries for 1769-1773 show both inward and outward entries. Thus, to avoid duplications in the Carolina and Georgia entries, only the net exports coastwise have been included. This adjustment cannot be made prior to 1769 , but samples from the WPA compilations (see general note for series Z 1-615) indicate that it is very minor.
The data for the various colonies are shown here, not because the individual details are necessarily accurate, but in order that scholars possessing more complete information may adjust the figures wherever possible.

The object of presenting these series is to provide the best possible pattern of the over-all development. The errors in detail are as likely as not to offset one another. Except for 1713-1731, when the estimates of the size of the barrels varied radically, the totals shown here should be within 5 percent of the true figure.
Data for 1783-1789 were compiled from records of Public Record Office, London Board of Trade, 6/21 ff.311-312. Shipping seasons for the crops of these years were: 1789 (crop of 1788), no limiting dates given; 1788 (crop of 1787), November 30, 1787-November 22, 1788; 1787 (crop of 1786), November 23, 1786-November 30, 1787; 1786 (crop of 1785), November 19, 1785-November 23, 1786; 1785 (crop of 1784), December 3, 1784-November 19, 1785; 1784 (crop of 1783), November 12, 1783-December 3, 1784; and 1783 (crop of 1782), January 17, 1783-November 12, 1783.

Z 486-492. Rice exported from Charleston, S.C., by destination, 1717-1766.
Source: Compiled by J. R. House from the WPA compilations of naval office lists at the University of California, Berkeley (see general note for series Z 1-615).

The differences in totals here and in series Z 481-485 may result in part from the differences in year-ending dates, as shown in the tabular headnotes.

## Z 493-499. Rice exported to England, by origin, 1698-1776.

Source: Compiled by Lawrence A. Harper, University of California, from English Inspector General's Ledgers of Imports and Exports, Public Records Office, London, Customs 3 (except 1727, from PRO T. $64 / 276 \mathrm{~B} / 323$ ).

A large proportion of the exported rice was reexported by England, not only to Northern but also to Southern Europe.
Z 500-503. Pitch, tar, and turpentine exported from Charleston, S.C., 1725-1774.
Source: 1725-1755, 1760-1764, 1767-1771, Charles J. Gayle, "The Nature and Volume of Exports from Charleston, 1724-1774," The Proceedings of the South Carolina Historical Association, Columbia, 1937, p. 31; 1756-1759, 1765, 1772-1774, South Carolina Gazette, Charleston, S.C., various issues.

The basic source for these series has been the South Carolina Gazette, which obtained the figures from the customhouse books and ran them as cumulative totals from November 1st of most years. The editorial policy of the Gazette was not consistent, however; it did not always list the same commodities each year, and sometimes it discontinued the cumulative totals before October 31st.

The WPA compilations (see general note for series Z 1-615) from the English copies of these same records (PRO C. O. 5) provide an alternate source for some years. They also distinguish in detail the destination of the various shipments.

Z 504-509. Timber and timber products exported from Charleston, S.C., and Savannah, Ga., 1754-1774.

Source: Series Z 504-506, 1754-1755, 1760-1764, 1767-1771, Gayle, cited above for series Z 500-503, p. 31; 1756-1759, 1765, 1772-1774, South Carolina Gazette, Charleston, S.C., various issues. Series Z 507-509, Oliver M. Dickerson, The Navigation Acts and the American Revolution, University of Pennsylvania Press, Philadelphia, 1951, pp. 26-27 (copyright).
The original figures for Savannah were compiled by the Comptroller at that port. For discussion of Charleston figures, see text for series Z 500-503.

Z 510-515. Number and tonnage of vessels built, by type, 1768-1773.
Source: Compiled by Jacob M. Price, University of Michigan, from George Chalmers, Opinions On Interesting Subjects . . . Arising From American Independence, London, 1784, p. 105.

Z 516-529. Vessels built in Thirteen Colonies and West Florida, 1769-1771.

Source: Compiled by Jacob M. Price, University of Michigan, from John, Lord Sheffield, Observations On the Commerce of the American States, 6th edition, London 1784, p. 96.

Z 530-533. Number of vessels engaged in whaling, and quantity and value of oil acquired, Nantucket, Mass., 1715-1789.
Source: 1715-1785, Obed Macy, The History of Nantucket, Hilliard, Gray \& Co., Boston, 1835, pp. 54-55 and 232-233; 1787-1789, U.S. Congress, American State Papers, Class 4, "Commerce and Navigation" (two volumes), vol. I, Gales and Seaton, Washington, D.C., 1832, p. 16.
The figures shown on pp. 232-233 of the source are stated to be from the Massachusetts Historical Society's Collections. Those on pp. 54-55 cite no authority; however, the Macy family descended from the first settlers and Obed Macy's data, which are generally consistent with information from other sources, provide the best figures now available.

The development of whaling in Nantucket followed the process typical of all the colonies [Walter S. Tower, A History of the American Whale Fishery (publications of the University of Pennsylvania, series in Political Economy and Public Law, No. 20), Philadelphia, 1907]. The early settlers first processed drift whales, then they engaged in the offshore fisheries which probably reached their height at Nantucket in 1726 when 86 whales were taken (Alexander Starbuck, The History of Nantucket, C. E. Goodspeed \& Co., Boston, 1924, p. 356). The first deep-sea venture occurred about 1712 when a strong wind blew an offshore vessel to sea where it caught a spermaceti whale (Macy, cited above, p. 36). By 1746, Nantucket whalers were making their way to Davis Straits and by 1774 they were sailing as far away as the coast of Brazil (Macy, cited above, p. 54).
The figures for Nantucket may be viewed in better perspective by noting that in 1730 the New England whaling fleet totaled 1,300 tons, and in 1763 that of Massachusetts consisted of 180 sailing vessels. (Raymond McFarland, A History of the New England Fisheries, D. Appleton and Company, New York, 1911, p. 86.) At the time of the Revolution, New England had 304 whalers totaling 27,840 tons out of an estimated American fleet of 360 vessels (Tower, cited above, p. 45; Starbuck, cited above, p. 176).

Z 534-538. State of the cod fishery of Massachusetts, 1765-1775.
Source: Stella H. Sutherland, Population Distribution in Colonial America, AMS Press, Inc., New York, 1966 (copyright). (The original source of the data is Timothy Pitkin, A Statistical View of the Commerce of the United States, p. 84.)

Dr. John J. McCusker, University of Maryland, in "Weights and Measures in the Colonial Sugar Trade: The Galion and the Pound and Their International Equivalents," William and Mary Quarterly, Third Series, vol. XXX, No. 4, October 1973, pp. 605 and 606, has supplied the following information on the definition of "quintal":
"The usual multiple of the pound was the hundred, called frequently the quintal and more fully the hundredweight (abbreviated $c w t$. or Ct. in eighteenth-century accounts). The hundredweight usually but not always equalled one hundred times the basic unit.
"By the middle of the seventeenth century, the great hundred of 112 pounds had become established for the English sugar trade as the standard hundredweight in the mother country but not consistently in the colonies. The English colonists on the North American continent bought and sold sugar by the great or long hundredweight, yet used the short hundredweight of 100 pounds for tobacco and codfish, commodities for which the mother country employed the long hundredweight."

Z 539-550. Daily wages of selected types of workmen, by area, 1621-1781.
Source: 1621-1670 and 1776-1781, Richard B. Morris, Government and Labor in Early America, Octagon Books, New York, 1975 (copyright 1946, and new foreword copyright (C) 1975, by Richard B. Morris); 1710, Richard Walsh, The Charleston Sons of Liberty, University of South Carolina Press, Columbia, 1959 (copyright).

The figures do not represent actual payments, which may have been higher, but they represent what the lawmakers believed was the proper maximum wage rate. Figures are payments to master craftsmen; journeymen received less (for example, 20 pence instead of 2 shillings in 1641).

For New Haven there were two wage rates-one for the summer, which is shown in these series, and one for the winter. For each occupation the winter rate was 6 shillings less in 1640 and 4 shillings less in 1641. Apparently the lower rate for the winter was paid because of the shorter workday.

The legislative rates also throw light on other labor facts. When New Haven set the rate for mowers in 1640, correlation of the daily wage ( 2 s .6 d .) with the rate for mowing an acre of fresh marsh shows that they considered it a day's work, although they believed that mowing a salt marsh would take longer and be worth 3 shillings. The next year they confessed the ratio was inadequate when they lowered the daily wages without board to 20 d . and raised the rate for mowing to 3 s . per acre for fresh marsh and 3 s .6 d . for salt marsh (Morris, cited above, pp. 79-80).

For discussion of the working day, see text for series Z 551-556.

## Z 551-556. Daily and monthly wages of agricultural Iaborers in

 Maryland, 1638-1676.Source: Manfred Jonas, "Wages in Early Colonial Maryland," Maryland Hisiorical Magazine, vol. LI, March 1956, pp. 27-38.

The source also gives additional information on the cost of living. Its basic data came from scattered items in the Archives of Maryland (a series of annual volumes published by the Maryland Historical Society, Baltimore).

In Maryland, during the first half of the 17 th century, the working month seems to have extended from 23 to 25 days and the working day from 10 to 12 hours. The 3 winter months were generally not included within the terms of labor contracts. Persons hired by the day worked the same hours and did not get lodging, but received at least 2 meals at the job (Jonas, cited above, pp. 30 and 34-35). In the other colonies the working day was probably much the same. New Haven, for example, specified in 1640 that a day's work was from 10 to 12 hours in summer and 8 hours in winter (Morris, Government and Labor . . ., cited above for series Z 539-550, pp. 59, 79, and 84).

## Z 557. Index of wholesale prices estimated for colonial and preFederal years, 1720-1789.

Source: U.S. Congress, Hearings Before the Joint Economic Committee, 85 th Congress, 1st session, Part II, Historical and Comparative Rates of Production, Productivity, and Prices (statement presented by Ethel D. Hoover, U.S. Bureau of Labor Statistics).

This index (which extends to 1958 in the source) was obtained by combining and splicing index numbers constructed by various investigators for different markets, to approximate a continuous series. The annual indexes were calculated by working forward and backward from the selected base period, $1850-59$. No adjustments were made to the original series for differences in coverage or in methods of calculation. However, when wholesale prices in two or more markets were combined, the necessary conversions to a common base period were made, and occasional estimates, as noted in other parts of the source, were used.

For this series, weighted combinations were made of the available index series for three major markets (Philadelphia, New York, and Charleston), except for the years prior to 1732 and the Revolutionary

War years. For these years, the estimates were based on Philadelphia prices only. The weights used to combine markets were rough approximations, based chiefly on estimates of the population and trade for each area and on the representative character and adequacy of the available indexes.

## Z 558-577. Average annual wholesale prices of selected commodities in Philadelphia, 1720-1775.

Source: Anne Bezanson, Robert D. Gray, and Miriam Hussey, Prices in Colonial Pennsylvania, University of Pennsylvania Press, Philadelphia, 1935, pp. 422-424 (copyright).

The primary source of the original data was the list of "prices current" which first appeared in 1719 in the American Mercury and which was continued in that and other newspapers. Gaps were usually filled by reference to merchants' account books and letterbooks (as discussed and listed in the source cited, pp. 3-5, 351-354, and $434-438$ ). The annual averages were computed 'by taking the arithmetic mean of the 12 average monthly prices in each year. When any monthly price was missing the available data were averaged quarterly and the annual figure derived from the quarterly averages. ... In some cases it was necessary to estimate a quarterly price by averaging the last monthly quotation in the previous quarter with the first monthly quotation in the following quarter. No annual price was estimated completely. . . ."

The source volume was sponsored by the International Scientific Committee in Price History, as were a number of other studies of colonial prices drawn together in A. H. Cole, Wholesale Commodity Prices in the United States: 1700-1861, Harvard University Press, Cambridge, 1938. In addition to discussion and analyses of prices, this publication offers a statistical supplement of monthly prices for the principal commercial centers. The tables in it, however, rest primarily upon the Philadelphia prices until the 1750 's. Prior to 1750 , Boston has only two series, wheat and molasses, which begin in 1720. Although there are gaps in the data, Charleston has series for bread, corn, rice, rum, wine, molasses, and staves beginning 1732; sugar beginning 1744; beef, pork, and indigo in 1747; and coffee, leather, and lumber in 1749 . New York has series for flour, bread, rice, sugar, salt, rum, and molasses beginning 1748; and for wheat, beef, and pork beginning 1749 .

Price series for the following Philadelphia commodities are shown in the source (not included here because of space limitations): Brown bread, white bread, London loaf sugar, Pennsylvania loaf sugar, indigo, bar iron, pig iron, hogshead staves, pipe staves, turpentine, and gunpowder. In addition to the annual averages, the source contains average monthly prices and monthly and annual indexes (both arithmetic and geometric) of 20 commodities in Philadelphia.

The unit of measure of Madeira wine (pipe) consists of 110 gallons. Barrels, in the case of beef and pork, consist of 31.5 gallons and hundredweights equal 112 pounds, except for tobacco where it equals 100 pounds.

## Z 578-582. Prices of Maryland tobacco, 1711-1775.

Source: Carville V. Earle, The Evolution of a Tidewater Settlement System: All Hallow's Parish, Maryland, 1650-1783, Ph.D. dissertation, University of Chicago, 1973.

The prices of tobacco are from the probate records, inventories and accounts of Anne Arundel and Prince Georges counties between 1711 and 1775 . The year runs from January 1 to December 31. Each year contains at least eight prices; the mean annual average is presented here. The prices are in British sterling. Accompanying the price series is a list of exchange rates for converting Maryland current money to sterling. In the probate records, where the tobacco prices appear, the monies of account are varied Maryland currencies which are overvalued in relation to sterling. Exchange rates between one of these currencies, Maryland current money, and sterling are frequent, and these administered rates provide the data for the exchange rate series. For each year, the modal exchange rate is entered.

So long as tobacco prices are in current money, they may be converted to sterling with this series. One problem concerns the years 1772 and 1773 when current money exchanged at $331 / 3$ and $662 / 3$; accordingly, for these years, two exchange rates and two tobacco prices are shown. A second problem occurs in 1757 when no one exchange rate is predominant; therefore, the mean exchange rate is used in preference to the mode.

## Z 583. Farm prices of Maryland tobacco, 1659-1710.

Source: Russell R. Menard, "Farm Prices of Maryland Tobacco, 1659 to 1710," Maryland Historical Magazine, LXVIII, 1973, pp. 80-85.

The series presents yearly means based on crop appraisals and other data found in all Maryland probate inventories filed between 1659 and 1710. Full documentation and a description of procedure is provided in the source.

## Z 584. Farm prices of Chesapeake tobacco, 1618-1658.

Source: Russell R. Menard, "A Note on Chesapeake Tobacco Prices, 1618 to 1660," (forthcoming) Virginia Magazine of History and Biography (copyright).

The series presents yearly means of price quotations found in correspondence, accounts of sales, promotional literature, court records, official proclamations, and legislative acts. Price quotations for Chesapeake tobacco in Europe and prices that appear to be deliberate exaggeration or understatements of the actual price were excluded from the mean. The means are based on few observations: in no one year did the number exceed ten; in most only two or three prices were found.

See source for further documentation and description of procedures.
Z 585. Annual rate of exchange on London for Pennsylvania currency, 1720-1775.
Source: See source for series Z 558-577, p. 432.
This series is derived from data in papers of Pennsylvania merchants and the Minutes of the Provincial Council (1739), supplemented in some years by Victor S. Clark, History of Manufactures in the United States, 1893-1928, vol. III, Carnegie Institution of Washington, D.C., 1916-1949, pp. 361-362. Bezanson et al., in Prices . . ., cited above, p. 431, also give monthly rates of exchanges during the same period.

Z 586. Annual price of an ounce of silver at Boston, Mass., 1700-1749.
Source: A. H. Cole, Wholesale Commodity Prices in the United States: 1700-1861, Harvard University Press, Cambridge, 1938, p. 119 (copyright).
The original shilling prices were taken from the Suffolk files by A. M. Davis, Currency and Banking in the Province of Massachusetts Bay, vol. I, Macmillan, New York, 1901, pp. 368 and 370. Where more than one price was given for a year, the high and low figures were averaged to determine the price for that year.

Z 587-598. Partial list of bills of credit and Treasury notes issued by American Colonies, 1703-1775.
Source: B. U. Ratchford, American State Debts, Duke University Press, Durham, 1941, pp. 26-27 (copyright).

These series attempt to show the issues of bills of credit and treasury notes emitted by the Colonies between 1703 and 1775. The $£ 82,000$ in bills issued by Massachusetts between 1690 and 1702 are not included, nor are the issues of Georgia, which never had a large debt. Under the trustees, the principal circulating medium in Georgia was the "sola" bills, issued only in the original by the trustees. A total of $£ 135,000$ of these bills of exchange were issued but only $£ 1,149$ remained unredeemed in 1752. Thereafter, Georgia emitted at least two issues of bills: One of $£ 3,000$ in 1756 and one of $£ 7,410$ in 1761 (Ratchford, cited above, p. 19).

Ratchford concedes that the list may be incomplete and that many of the issues listed were not made at the time nor in the exact amount stated. Sometimes the law authorizing the issue constitutes the only evidence, and nothing indicates "how, when, or to what extent the issue was actually made."

The original source for $1737-1748$ for Massachusetts is A. M. Davis, cited above in text for series Z 586. Davis expressed all issues in the terms of old tenor (the form of bills which existed in February 1737). Ratchford did not follow this procedure because he did not feel sufficiently acquainted with the circumstances in each case to make the conversion with assurance. For all other years, the data rest upon a variety of sources cited in the footnotes of Ratchford's first chapter, which provide a helpful bibliography for further reference.

The footnotes to these series indicate the principal purposes for which the larger issues were made. For years when several issues appeared for different purposes, the footnotes indicate the purpose for issuing the majority of the bills.

## Z 599-610. Paper money outstanding in American Colonies, 17051775.

Source: See source for series Z 587-598, p. 28.
The original sources of the data are various monographs cited in Ratchford's first chapter. Unfortunately, the authors of these monographs did not always attempt to find or to make estimates themselves. Some of the estimates are those of legislative committees or public officials and, less frequently, of contemporary writers. Many of the estimates for 1739 and 1748 come from William Douglass whose work is discussed in Charles Bullock, Introduction, Economic Studies of the American Economic Association, vol. II, No. 1. Georgia did not warrant a separate series, the only estimate being one for £5,500 for 1761.
For approximately a fifth of the figures, the actual year of issuance differs from that indicated in this table by one or two years; for exact year of issuance, see source.

## Z 611-615. Tax collections in America under the different revenue laws, 1765-1774.

Source: Oliver M. Dickerson, The Navigation Acts and the American Revolution, University of Pennsylvania Press, Philadelphia, 1951, p. 201 (copyright).

Tax records have long been an untapped source of economic data. Dickerson has gathered figures from the English Treasury Papers for both the revenues collected under the Navigation Act of 1673 ( 25 Car. II c 7) and the new revenue measures which followed the French and Indian War (1763). He estimates (p. 202) that seizures (often highly technical) under the new revenue program cost the Americans not less than $£ 60,956$ "exclusive of fees, direct plunder, and costs of defending suits in the admiralty courts."

[^234]:    ${ }^{1}$ Only the most salient of such interventions are mentioned here, specifically as they apply to the composition of the potentially eligible electorate. They are:
    The Reconstruction Act of March 2, 1867, which (with the Supplemental Act of March 23 , 1867) required that the ten ex-Confederate States still without Federal representation eliminate all racial barriers to the suffage as a precondition for readimission.
    The Fifteenth Amendment to the Constitution (1870), which forbade either the States or the Federal Government to deny the right of citizens to vote "on account of race, color, or previous condition of servitude," and subsequent implementing legislation of 1870 , 1871 , and 1875. (See also Guinn ". United States, 238 U.S. 347 (1915), in which the Supreme Court struck down the "graadfather clause" as a patent attempt to evade the command of this Amendment.)
    The sameteenth Amendment to the Constitution (1920), which enfranchised women on the same constitutional terms as men.
    political parties, being private associations, white primary, and of the doctrine that chose to exclude from their nominating processes. (Siude Negroes or any others they (1944).)

    The Twenty-third Amendment to the Constitution (1961), extending presidential suffrage to the District of Columbia.

    The Twenty-fourth Amendment to the Constitution (1964), prohibiting the levying of a poll tax or any other tax as a prerequisite to voting in Federal elections. (See also the Supreme Court's extension of this prohibition to State and Iocal elections as well, Harper v. Virginia State Board of Elections, 383 U.S. 663 (1966).)
    The Civil Rights Act of 1965 suspending all literacy tests in Alabama, Alaska, Georgia, Louisiana, Mississippi, South Carolina, Virginia, 40 counties in North Caroina, and one county in Arizona, and establishing Federal registrars in the affected areas. extended it to all literacy tests; lowered the minimum voting age from 21 to 18 in all Federal and State elections; and lowered the minimum residence requirement for roting in presidential elections to a uniform 30 days.
    The Twenty-sixth Amendment to the Constitution (1971) which formally reaffirmed the lowering of the voting age minimum from 21 to 18 years.

[^235]:    ${ }^{2}$ In 1910, as the consequence of the influx of the "new immigration" after 1900 to all foreign-born from 70.3 percent in 1890, to 69.6 percentage decline of naturalized percent in 1910.

[^236]:    ${ }^{3}$ These include such States as Iowa, Michigan, Massachusetts, and above all, New York between 1845 and 1875 . There is a mass of potentially useful and still unrecovered or unsused State material which should be employed for the nineteenth century. Such material includes lists of taxables triennially compiled from 1814 through 1828 in Pennsylvania (available in Hazard' Register ( 1825 (1835)), and the Missouri State census of 1844, available only as an appendix to the Misoouri Senate Journal (1845).

[^237]:    16 electors voted for Harry F. Byrd.
