For a discussion of the data and methodology of estimation of Government-owned, privately operated assets for each of the four major owning agencies-Department of Defense, Atomic Energy Commission, Maritime Administration, and National Aeronautics and Space Administration-see pages T-22 and T-23 of source.

P 123-176. Capital in manufacturing industries, in book value and in 1929 dollars (Creamer), 1879-1957.

Source: 1879-1937, Daniel Creamer, Sergei Dobrovolsky, and Israel Borenstein, Capital in Manufacturing and Mining: Its Formation and Financing, Princeton University Press, 1960, Appendix A, tables 8 and 9; 1948-1957, Daniel Creamer, Capital Expansion and Capacity in Postwar Manufacturing, National Industrial Conference Board, Inc., New York, Studies in Business Economics, No. Seventy-Two, 1961, Appendix G, tables G-1 and G-2. (Copyright.)

Estimates for 1879-1919 are based on data in various reports of the census of manufactures. For 1929-1957, the estimates are based on balance sheet data of corporations (raised to the level of all firms) published by the Internal Revenue Service (formerly Bureau of Internal Revenue) in Statistics of Income. Fixed capital includes land, buildings, and equipment (all net of depreciation). Working capital includes all other assets, other than investments in securities (chiefly cash, accounts and notes receivable, and inventories). Structures and equipment owned by the Federal Government but operated by private firms are excluded in all years. For a detailed description of data, adjustments and limitations, see Appendix A, section A, of the first source.

Figures in 1929 dollars were derived by dividing the estimates of capital in book values, by price indexes of book values expressed in 1929 prices. The latter are the implicit indexes derived by dividing the sum of the reported book values of the 15 major industry groups
comprising all manufactures by the sum of the book values expressed in 1929 prices of the 15 major groups.

The general procedure for deflating capital is to derive a composite index of prices underlying book values of buildings, machinery and equipment, and working capital for each of the 15 major industrial groups shown here. A construction cost index weighted by volume of construction depreciated over 50 years is used to represent the changes in the book value of land and buildings. This component of the composite index is identical for all 15 groups. For machinery and equipment, a price index of general machinery and equipment is used for all 15 groups, but in each group the index is weighted by volume of machinery and equipment produced, depreciated according to length of life typical for a given industry as reported by the Internal Revenue Service in Income Tax, Depreciation and Obsolescence, Estimated Useful Lives, and Depreciation Rates, Bulletin F. Because of these changing industry weights, a different deflator for machinery and equipment is obtained for each major group. The wholesale price index of the output of a given major industry is used to deflate working capital.

For derivation of the deflators for each of the 15 major groups, see Appendix A, section B, of the first source.

P 177-196. Share of total value added by manufactare accounted for by the 200 largest manufacturing companies, and by the 50 and 100 largest identical manufacturing companies, 1947-1970.

Source: U.S. Bureau of the Census. 1947-1967, 1967 Census of Manufactures, vol. I, p. 9-6; 1970, Annual Survey of Manufactures, Value of Shipment Concentration Ratios, M70 (AS)-9.

Data for 1962 and 1966 are based on the annual survey of manufactures; other years on the census of manufactures.
These data reflect the activity of the largest companies in the industrial sector as a whole. A company is defined as the total of its industrial establishments, including not only its manufacturing plants but also auxiliary establishments such as warehouses and central administrative offices. Value added for all manufacturing establishments of a given company was aggregated irrespective of the industry classification of the individual establishments. The companies were then arrayed by magnitude of value added in each specified year and totals were computed for the $50,100,150$, and 200 largest companies.

The rankings in 1947 and 1954 were based on unadjusted value added; those for later years on adjusted value added. See text for series P 10 .

For series P 177-180, companies were classified in size groups in each particular year based on their size in that year. The largest companies are those which were the largest in each of the specified years. Thus, a size group, such as the top four, does not necessarily include the same companies from year to year.

For series P 181-196, the 100 largest companies in each year specified in the stub of the table were selected and their proportion of total value added by manufacture in each of the years shown in the column headings was computed. These data thus measure the changes in concentration ratios for a fixed group of companies from one year to another. In case of mergers, the larger of the two at the time of merger was considered to be the predecessor company.

## P 197-204. Concentration in manufacturing, by indastry group, 1901, 1947, and 1954.

Source: Series P 197, G. Warren Nutter, The Extent of Enterprise Monopoly in the United States, tables 10 and 39, copyright 1951 by The University of Chicago. Series P 198, M. A. Adelman, "The Measurement of Industrial Concentration," Review of Economics and Statistics, vol. 33, November 1951, table 14 (copyright, Harvard College; based on Hearings Before the Subcommittee on Siudy of Monopoly Power, House of Representatives, 81st Congress, 1st session, Serial No. 14, part 2-B, pp. 1436-1456). Series P 199-200 are tabulations prepared by the Bureau of the Census from data reported in the census of manufactures. Series P 201-204, Irving Rottenberg, "New Statistics
on Companies and on Concentration in Manufacturing From the 1954 Census," Proceedings of the American Statistical Association, 1957, table 5 (copyright).

The basic source of most of the data in all columns is the census of manufactures. The concentration ratio is defined as the percent of total industry sales (or, occasionally, value added) made by the four largest sellers.

The entries for series P 197-198 represent the value added by manufacture in 4-digit SIC industries (see general note for series P 1-374) with concentration ratios of 50 or higher, as a percentage of value added by all 4-digit industries included in each 2 -digit industry group (e.g., "food and kindred products" is a 2 -digit group containing "meatpacking plants" and 2 other 4 -digit meat industries, "creamery butter" and 5 other 4 -digit dairy industries, etc.).

The figures for series P 199-204 are average concentration ratios for each 2-digit industry group, i.e., the concentration ratio of each 4-digit industry is weighted in proportion to its employment or value added, as indicated, as a proportion of total employment or total value added by the whole 2 -digit group.

Series P 199-200 include all industries for the given year-452 in 1947, and 434 in 1954. Because of changes in 4-digit industry definitions, concentration ratios are not fully comparable. Series P 201204 are based on 375 comparable industries accounting for 85 percent of all value added by manufacture in 1947, and for 82 percent in 1954.

The first total line is a set of weighted averages based on valueadded weights derived from the basic data for the respective years shown. Figures on the second total line (for series P 201-204) are averages of the concentration ratios shown for the 20 industry groups.

Where the change in concentration, 1947-1954, as shown in series P 199-200, is substantially different from that shown in series P 201204, the difference is due to industry redefinition and to inclusion or exclusion of industries from the census of manufactures. A striking example is in group 39, "miscellaneous manufactures" from which major group 19, "ordnance and accessories," was omitted for national security reasons.

P 205-211. Selected statistics for operating manufacturing establishments, by legal form of organization, 1939-1967.
Source: U.S. Bureau of the Census, 1939, Sixteenth Census of the United States: 1940, Census of Manufactures, 1939, vol. I, p. 230; 1947-1967, 1967 Census of Manufactures, vol. I, p. 3-4.
Each establishment included in the censuses of manufactures was classified into one of the following legal forms of organization:

Corporate-an establishment (other than a cooperative) owned by an organization or company legally incorporated under State laws.

Noncorporate--individual proprietorships, partnerships, cooperatives, establishments operated by estate administrators, trusteeships, receiverships, public and quasi-public organizations, and, in addition, misassignments of small establishments that were not corrected because they were not statistically significant.

Individual proprietorship-an establishment owned by one person, who may or may not actively participate in the operation of the business.

Partnership-an establishment owned by two or more persons, each of whom has a financial interest in and responsibility for the business. A partner may or may not actively participate in the operation of the business.
See also text for series P 1-12.
P 212-215. Percent distribution of production workers and of value added in manufacturing establishments, by legal form of ownership, 1899-1967.
Source: U.S. Bureau of the Census. 1899, Census of Manufactures: 1905, part I, p. liv; 1904 and 1909, Thirteenth Census of the United

States, 1910, Manufactures: 1909, vol. VIII, p. 135; 1914 and 1919, Fourteenth Census of the United States, 1920, Manufactures: 1919, vol. VIII, p. 108; 1929, Fifteenth Census of the United States, 1930, Manufactures: 1929, vol. I, p. 95; 1939, Sixteenth Census of the United States, 1940, Manufactures: 1939, vol. I, p. 229; 1947-1967, U.S. Census of Manufactures, 1967, vol. I.

Percentages were computed from figures published in the various Bureau of the Census reports cited as sources.

See also data and text for series P 205-211.

## P 216-226. Consumption of energy materials, 1899-1967.

Source: U.S. Bureau of the Census. Thirteenth Census of the United States: 1910, vol. X, p. 662; Census of Manufactures: 1963, vol. I, pp. 7-90 and 7-91; and Census of Manufactures: 1967, Special Report MC67(S)-4, Fuels and Electric Energy Consumed, pp. 8-9.
Data for fuels consumed for heat and power were converted to kilowatt-hour equivalents, the international unit of energy, and then added to the quantity of purchased electric energy. The conversion factors used for each fuel are shown in the source reports. For fuels, quantities include both fuels purchased for use as fuel and fuels made and used in the same establishment.

## P 227. Coffee imported, 1860-1970.

Source: 1860-1914, see source for series P 17, pp. 8-9 and 143-144; 1915-1929, see Arthur F. Burns, pp. 292-293, cited as source for series P 231; 1930-1947, U.S. Bureau of the Census, Foreign Commerce and Navigation of the United States; 1948-1962, same agency, Quarterly Summary of Foreign Commerce of the United States, for those years; 1963-1970, same agency, U.S. Imports of Merchandise for Consumption, Reports FT 110, FT 125, and FT 135, calendar year issues.
The data for 1860-1933 are described as net imports (general imports) minus foreign exports; for 1934-1970, they are described as imports for consumption minus foreign exports. However, on dutyfree commodities, like coffee, general imports equal imports for consumption. Data cover U.S. customs area, which includes Alaska, Hawaii, and Puerto Rico.

## P 228. Raw cotton used in textiles, 1860-1970.

Source: U.S. Bureau of the Census. 1860-1909, Bulletin 160, Cotton Production and Distribution, 1926, p. 49; 1910-1945, Bulletin 183, Cotton Production and Distribution, 1946, pp. 26-31; 1946-1962, Cotton Production and Distribution, annual reports; 1963-1970, Current Industrial Reports, series M22P, Cotton, Man-Made Fiber Staple, and Linters, Summary for Cotton Season, various annual issues.

Data are for years ending August 31 through 1910, July 31 thereafter. Figures are in running bales, except that for 1860-1870, they are in equivalent 500 -pound bales. Data exclude linters for $1860-$ 1908 and include them thereafter.

## P 229. Wool used in textiles, 1918-1970.

Source: U.S. Bureau of the Census. 1922-1957, Facts for Industry, Wool Consumption and Stocks, monthly issues. (Title may vary for this report.) 1958-1970, Current Industrial Reports, series M 220, Consumption on the Woolen and Worsted Systems, monthly issues.

Figures relate to scoured wool plus greasy wool reduced to a scoured basis, assuming average yields varying with class, origin, grade, and whether shorn or pulled. For 1946-1970, they include raw wool consumed in woolen and worsted systems only.

For a series on apparent consumption of all wool, 1870-1929, see Arthur F. Burns, pp. 296-297, cited as source for series P 231.

## P 230. Unmanufactured silk imports for consumption, 1883-1970.

Source: 1883-1929, see Arthur F. Burns, pp. 294-295, cited as source for series P 231; 1930-1931, U.S. Bureau of Foreign and Domes-
tic Commerce, Foreign Commerce and Navigation of the U.S., vol. I, for respective years; 1932, U.S. Bureau of the Census, Statistical Abstract of the United States, 1940, p. 732; 1933-1949, Statistical Abstract, 1950, p. 638; 1950-1955, Textile Economics Bureau, Inc., New York, Textile Organon, vol. XXXVII, No. 3, March 1966; 1955-1970, Textile Organon, March 1971.
Figures are derived by subtracting foreign exports from general imports of all types of unmanufactured silk. Spun silk is not included.
For a series on raw silk imports (excluding silk from cocoons and waste) for 1860-1914, see source for series P 17, pp. 8-9 and 153-155; and for 1870-1929, see Arthur F. Burns, cited above.

## P 231. Wheat flour produced, 1860-1970.

Source: 1860-1914, see source for series P 17, pp. 8-9 and 135-139; 1915-1929, Arthur F. Burns, Production Trends in the United States Since 1870, National Bureau of Economic Research, New York, 1934, pp. 299 and 339 (copyright); 1931 and 1933, Solomon Fabricant, The Output of Manufacturing Industries, 1899-1937, National Bureau of Economic Research, New York, 1940, p. 395 (copyright; data from census of manufactures); 1935-1970, U.S. Dept. of Agriculture, Economic Research Service, Agricultural Economic Report No. 138, Food Consumption, Prices, and Expenditures, and Supplement for 1970.
Reported data in hundredweights were converted to barrels containing 196 pounds of flour. These estimates are based on commercial production of wheat flour reported by the Bureau of the Census. They include flour milled in bond from foreign wheat plus the estimated flour equivalent of farm wheat ground for flour or exchanged for flour for farm household use.

## P 232. Refined sugar produced, 1860-1970.

Source: 1860-1914, see source for series P 17, pp. 8-9 and 139-143; 1919-1933, see Solomon Fabricant, pp. 382 and 387, cited as source for series P 231; 1934-1945, U.S. Department of Agriculture, Agricultural Statistics, 1952, p. 111; 1946-1960, Agricultural Statistics, 1967, p. 83; 1961-1970, Agricultural Statistics, 1971, p. 88.

Figures represent production in cane-sugar refineries and in beetsugar factories.

## P 233. Canned corn produced, 1885-1970.

Source: 1885-1908, see Arthur F. Burns, pp. 300-301 and 341, cited as source for series P 231; 1909-1970, National Canners Association, Canned Food Pack Statistics, 1971-72.

A case consists of 24 No. 2 cans.

## P 234. Canned tomatoes produced, 1885-1970.

Source: 1885-1898, 1900-1903, and 1905-1907, see Arthur F. Burns, pp. 300-301 and 341, cited as source for series P 231. National Canners Association, 1899 and 1904, Canned Food Pack Statistics, 1969-70; 1908-1970, Canned Food Pack Statistics, 1971-72.

A case consists of 24 No. 2 cans. The figures for 1885-1907 were published in the unit case of 24 No .3 cans. They have been converted to a unit case of 24 No. 2 cans by multiplying by 1.707. The conversion factor is taken from National Canners Association, Washington, D.C., Canned Food Pack Statistics: 1940, part 1-Vegetables, March 1941, p. 19.

Except for some of the early historical data which came from reports of the Bureau of the Census, the data have been compiled by the National Canners Association with the cooperation of State, regional, and commodity associations.

## P 235. Beer produced, 1870-1970.

Source: 1870-1929, see Arthur F. Burns, pp. 292-293, cited as source for series P 231. U.S. Internal Revenue Service (formerly

Bureau of Internal Revenue), 1930-1932, unpublished data; 1933, Annual Report of the Commissioner of Internal Revenue, 1936; 19341970, U.S. Bureau of Alcohol, Tobacco and Firearms, Alcohol, Tobacco and Firearms, Summary Statistics, 1973, p. 41.
The unit 'barrel" contains 31 wine gallons. For 1921-1933, only cereal beverages were permitted to be produced.

P 236-236a. Distilled spirits produced, 1870-1970.
Source: 1870-1929, see Arthur F. Burns, pp. 292-293, cited as source for series P 231. U.S. Internal Revenue Service (formerly Bureau of Internal Revenue), 1930-1933, Annual Report of the Commissioner of Internal Revenue, annual issues. 1934-1970, see source for series P 235, p. 20.
The computation of taxable gallons excludes all fractional parts of a proof gallon less than one-tenth. Figures are for years ending June 30 and include data for Hawaii; beginning 1928, they also include data for Puerto Rico. Series P 236 includes industrial alcohol for all years. Series P 236a was derived by subtracting figures for industrial alcohol (i.e., tax-free withdrawals) from total distilled spirits production.

## P 237-238. Fats and oils produced, 1922-1970.

Source: U.S. Bureau of the Census. 1922-1940, Animal and Vegetable Fats and Oils, annual issues; 1941-1970, Current Industrial Reports, series M20J and M20K, Fats and Oils, 1970 and earlier years, summary issues (prior to 1958, series M 17-1, M 17-2, and M 28).

## P 239. Manufactured tobacco and snuff products, 1870-1970.

Source: 1870-1879, see source for series P 17, pp. 14-15 and 192193; 1880-1929, see Arthur F. Burns, pp. 296-297, cited as source for series P 231; 1930-1970, U.S. Department of Agriculture, Agricultural Statistics, 1952, 1957, 1962, 1967, and 1971 editions.
Primary source of the figures is the Annual Report of the Commissioner of Internal Revenue.

## P 240. Cigars, 1870-1970.

Source: 1870-1879, see source for series P 17, pp. 14-15 and 189191; 1880-1929, see Arthur F. Burns, pp. 298-299, cited as source for series P 231. U.S. Internal Revenue Service (formerly Bureau of Internal Revenue), 1930-1939 and 1941-1949, Annual Report of the Commissioner of Internal Revenue, various issues; 1940 and 1950-1970, Alcohol and Tobacco Summary Statistics, annual issues.
For 1870-1949, figures exclude cigars weighing not more than 3 pounds per 1,000.

## P 241. Cigarettes, 1870-1970.

Source: 1870-1879, see source for series P 17, pp. 14-15 and 192; 1880-1929, see Arthur F. Burns, pp. 298-299, cited as source for series P 231; 1930-1970, see source for series P 240.
Figures represent large and small cigarettes and small cigars for 1870-1949, excluding those manufactured in bonded manufacturing warehouses. For 1954-1970, small cigars are excluded.

## P 242-243. Apparel products, 1927-1970.

Source: U.S. Bureau of the Census, Current Industrial Reports, series MA23A, Annual Apparel Survey, 1970 and earlier years, summary issues.
Men's and boys' suits and separate coats represent (1) men's suits, excluding ski, slack, snow, and uniform, (2) men's tailored dress and sport coats and jackets, excluding uniform, (3) boys' tailored dress and sport coats, and (4) boys' suits, including students', cadets', and junior boys'.
Women's, misses', and juniors' dresses include both dresses sold at a unit price and those sold at a dozen-price.

P 244. Rayon and acetate yarns available, 1911-1970.
Source: 1911-1939, Textile Economics Bureau, Inc., New York, Textile Organon-Base Book of Textile Statistics, vol. XXXIII, No. 1, January 1962; 1940-1955, Textile Organon, January-February, 1971; 1956-1970, Textile Organon, March 1971. (Copyright.)
Figures represent producers' domestic shipments plus imports of yarn and exclude staple, tow, waste, and other rayon and acetate products. Data for rayon relate to manmade fibers produced by the viscose, cuprammonium, and nitrocellulosic (discontinued after 1934) processes. Rayon horsehair and straw are included in the filament yarn figures for 1952-1970 (for 1940-51, production of these items averaged just under 1 million pounds per year). Acetate means manmade fibers composed of cellulose acetate and triacetate.
For 1941-1970, figures for rayon and acetate are as actually reported by the entire industry; earlier data are estimated totals based on reports obtained from 86 percent or more of the industry, with adjustments for complete coverage in accordance with information from the census of manufactures.

## P 245. Non-cellulosic yarn available, 1940-1970.

Source: See source for series P 244, 1940-1970.
Data include producers' domestic shipments plus imports of yarn and exclude staple and tow.

## P 246. Finished knit cloth shipped, 1933-1970.

Source: U.S. Bureau of the Census, Current Industrial Reports. 1933-1946, series M67C, Underwear and Allied Products: Underwear, Knit Cloth, and Knit Fabric Gloves; and Underwear and Knit Cloth for Sale; 1947-1965, series M22K, Knit Cloth for Sale; 1966-1970, series MQ22K, Shipments of Knit Cloth, summary issues.

## P 247. Carpets and rugs shipped, 1899-1970.

Source: U.S. Bureau of the Census. 1899-1947, Census of Manufactures reports; 1954-1970, Current Industrial Reports, series M22L and MQ22K, Carpets and Rugs, summary issues.

P 248-250. Sodium hydroxide and ammonia produced, 1899-1970.
Source: U.S. Bureau of the Census. 1899-1939, Census of Manufactures reports; thereafter, Current Industrial Reports, series M28A, Inorganic Chemicals, summary issues.

## P 251. Sulfuric acid produced, 1899-1970.

Source: U.S. Bureau of the Census. 1899-1927, unpublished data; 1929-1970, Current Industrial Reports, series M28A, Inorganic Chemicals, summary issues.

Figures are combined totals for sulfuric acid produced by the contact and chamber processes, including spent acid fortified in the contact plants with the simultaneous production of new acid. Production of Government-owned plants, which was large during the war period, is not included for that period; for the most part, this production was available only for military use. However, for 19541970, appreciable amounts of sulfuric acid produced in Governmentowned privately operated plants are included. Figures for 1946-1950 include estimates based on annual totals of byproduct operations of a few smelters reporting to the Bureau of Mines; the estimated data included vary from 4 percent in 1946 to 2 percent in 1950. For 1899-1939, figures are based on reports of the Census of Manufactures; they are shown in those reports on a $50^{\circ}$ Baume basis but are here converted to 100 percent $\mathrm{H}_{2} \mathrm{SO}_{4}$. Beginning January 1948, figures are not strictly comparable with earlier data because of the inclusion of additional plants; however, the addition of these plants increased the production of the specified chemical by less than 3.5 percent.

P 252. Paints, varnishes, and lacquers produced, 1899-1970.
Source: U.S. Bureau of the Census. 1899-1947, Census of Manufactures, reports for various census years; 1953-1970, Current Industrial Reports, series M28F, Paint, Varnish, and Lacquer, summary issues.

## P 253. Superphosphates produced, 1860-1970.

Source: 1860-1954, U.S. Department of Agriculture, Statistics on Fertilizers and Liming Materials in the United States, Statistical Bulletin No. 191, p. 43, April 1957; 1955-1957, U.S. Bureau of the Census, Facts for Industry, series M19D-06 and M19D-08; 19581970, Current Industrial Reports, series M28B, Inorganic Fertilizer Materials and Related Acids, summary issues.

## P 254. Light products of distillation, 1918-1970.

Source: U.S. Bureau of Mines, Mineral Industry Surveys, 'Petroleum Statements," annual issues.

These figures relate essentially to the production of gasoline and naphtha. Figures for 1918-1927, 1929-1956, and 1962-1963 are not strictly comparable. The figure for 1929 on a basis comparable with preceding years is 438 million barrels. For 1953-1970, figures for jet fuel are excluded.

## P 255. Illuminating oils (kerosene) produced, 1916-1970.

Source: U.S. Bureau of Mines, Mineral Industry Surveys, "Petroleum Statements," annual issues.

Figures for 1916-1927, 1929-1956, and 1962-1963 are not strictly comparable. The figure for 1929 comparable with the preceding years is 55.7 million barrels. For 1953-1959, figures exclude jet fuel. Beginning 1960, data include jet fuel used in commercial aircraft; beginning 1965, they include kerosene-type jet fuels.

## P 256. Fuel oils produced, 1916-1970.

Source: See source for series P 255.
Figures for 1916-1927, 1929-1956, and 1962-1963 are not strictly comparable. The figure for 1929 comparable with the preceding years is 390 million barrels. For 1953-1970, jet fuels are excluded.

## P 257. Lubricating oils produced, 1916-1970.

Source: See source for series P 255.
Figures for 1916-1927 and 1929-1956 are not strictly comparable. The figure for 1929 comparable with preceding years is 37 million barrels.

## P 258. Paraffin wax produced, 1916-1970.

Source: See source for series P 255.
For 1929-1956, figures are labeled petroleum wax. The basic source of these data is the Bureau of Mines, Minerals Yearbook.

## P 259. Pneumatic motor vehicle tires produced, 1914-1967.

Source: U.S. Bureau of the Census, Census of Manufactures, reports for various census years.

## P 260-261. Men's and women's shoes produced, 1899-1970.

Source: 1899-1919, see Solomon Fabricant, cited as source for series P 231; U.S. Bureau of the Census, 1921-1946, Statistical Abstract of the United States, various editions, 1929-1947; 1947-1954, unpublished data; 1955-1970, Current Industrial Reports, series M31A, Shoes and Slippers, summary issues.

Figures represent pairs of leather uppers for men's and women's shoes. They do not include youths' and boys', misses', children's,
infants', athletic, part leather, or nonleather shoes. For 1930-1970, figures for men's shoes are not strictly comparable with earlier years because large quantities of heavy footwear included with men's shoes for later years were included with athletic shoes for earlier years.

## P 262. Rails produced, 1860-1970.

Source: 1860-1872, see source for series P 17; 1873-1970, American Iron and Steel Institute, Annual Statistical Report, various issues, 1965-1970 (copyright); and unpublished data.
Figures include both iron and steel rails, rerolled rails, and girder and high T rails. Rails are a component of "hot rolled iron and steel," series P 270. For 1860-1867, figures include production of iron rails only.

## P 263. Structural iron and steel shapes produced, 1879-1970.

Source: 1879-1889, see source for series P 17; 1892-1970, American Iron and Steel Institute, Annual Statistical Report, various issues (copyright), and unpublished data.
Structural shapes are a component of "hot rolled iron and steel," series P 270.

## P 264. Common and face brick produced, 1869-1970.

Source: 1869-1899 (decennially), 1904, 1909, 1914, 1919-1939 (biennially), 1947, 1954, 1958, 1963, and 1967, U.S. Bureau of the Census, Census of Manufactures, reports for various years; 1895-1912, U.S. Geological Survey, Mineral Resources of the United States, various issues; 1913-1959, U.S. Bureau of the Census, Facts for Industry, Clay Construction Products, summary issues; 1960-1970, Current Industrial Reports, series M320, Clay Construction Products, summary issues.

The figures for 1869 and 1879 are for common brick only. For 1889,1899 , and 1904, the production of "fancy or ornamental brick" has been added to the production of "face brick," the reason being that 'the best grade of 'face' or 'front' brick appears to have been classified as 'fancy or ornamental' brick' in these years. Beginning 1943, common and face brick are classified as "unglazed" brick.

## P 265-269. Raw steel produced, 1860-1970.

Source: American Iron and Steel Institute, Annual Statistical Report, various issues (copyright).

For 1934-1970, figures include only that part of steel castings made in foundries producing steel ingots.

## P 270. Hot rolled iron and steel produced, 1864-1970.

Source: American Iron and Steel Institute, Annual Statistical Report, various issues, 1965-1970 (copyright), and unpublished data.

Figures include rails, plates and sheets, merchant bar and skelp production, wire rods, and structural shapes.

P 271. Copper and copper base alloy, rolled, drawn, and extruded products shipped, 1925-1970.
Source: U.S. Bureau of the Census. 1925-1947, see source for series P 259; 1952-1970, Current Industrial Reports, series BDSAF-84, Shipments of Copper-Base Mill and Foundry Products, summary issues.

## P 272-274. Fabricated metal products, 1941-1970.

Source: U.S. Bureau of the Census, Current Industrial Reports, series M34D, Metal Cans, and series M34N, Heating and Cooking Equipment (Except Electric), summary issues.

Warm air-furnaces, P 273, include oil- and gas-fired furnaces sold as component parts of "year-round air-conditioning units."

P 275-276. Gasoline and diesel engines produced, 1947-1970.
Source: U.S. Bureau of the Census, Current Industrial Reports, series MA35L, Internal Combustion Engines, summary issues.

Production data exclude engines for outboard, automotive, and aircraft purposes.

## P 277. Wheel tractors, complete, produced, 1922-1970.

Source: U.S. Bureau of the Census, Current Industrial Reports, series M35S, Tractors (Except Garden Tractors), summary issues.

## P 278. Metal cutting machines shipped, 1947-1970.

Source: U.S. Bureau of the Census, Current Industrial Reports, series M35W, Metalworking Machinery, summary issues.

## P 279. Typewriters shīpped, 1900-1970.

Source: U.S. Bureau of the Census, Current Industrial Reports, series M35C, Typewriters, summary issues.
Except as indicated in footnotes, standard electric and manual and portable models are included.

## P 280. Room air-conditioners shipped, 1945-1970.

Source: U.S. Bureau of the Census, Current Industrial Reports, series M35M, Air-Conditioning and Refrigeration Equipment, summary issues.

P 281-282. Fractional horsepower motors and integral horsepower motors and generators shipped, 1914-1970.
Source: U.S. Bureau of the Census. 1914-1958, see source for series P 259; thereafter, Current Industrial Reports, series M36H, Motors and Generators, summary issues.

P 283-285. Domestic ranges, electric, shipped; household refrigerators produced; and household washing machines, mechanical, shipped, 1921-1967.
Source: Series P 284, 1921-1937, see Solomon Fabricant, p. 585, cited as source for series P 231; all other data, see source for series P 259.

## P 286-287. Electric lamps produced, 1899-1970.

Source: U.S. Bureau of the Census. 1899-1939, see source for series P 259; thereafter, Current Industrial Reports, series M36B and M36D, Electric Lamps.

P 288-290. Home-type radio receivers, home-type radio-phonograph combinations, and phonographs shipped, 1899-1970.

Source: U.S. Bureau of the Census. 1899-1939, see source for series P 259; thereafter, Current Industrial Reports, series MA36M, Home-Type Radio Receivers and Television Sets, Automobile Radios, Phonographs, and Record Player Attachments.

Home-type radio receivers and radio-phonograph combinations for 1923-1939 include automobile sets.

P 291. Trailer coaches, housing type, shipped, 1937-1967.
Source: See source for series P 259.

## P 292. Truck trailers shipped, 1935-1970.

Source: U.S. Bureau of the Census. 1935-1939, see source for series P 259; thereafter, Current Industrial Reports, series M37L, Truck Trailers, summary issues.

## P 293. Locomotives produced, 1880-1967.

Source: 1880-1929, see Arthur F. Burns, pp. 300-301, cited as source for series P 231; 1930-1945, American Railway Car Institute, Railway Age, Annual Statistical and Outlook Number, January 6, 1945, p. 91, and Annual Statistical and Outlook Number, January 5, 1946, p. 88 (copyright); 1947-1967, see source for series P 259.
For 1905-1945, Canadian output is included although the U.S. output is shown separately beginning with 1929 (see, for example, Railway Age, Annual Statistical Number, January 4, 1947). For 1880-1911, locomotives built in railroad repair shops are excluded. For 1942-1944, figures exclude locomotives built for U.S. Government and for lend-lease program.

This series was discontinued when the new traction power was supplied almost exclusively by diesel units. A locomotive may be composed of one or more diesel units.

Data for 1947-1967, which are from the census of manufactures, represent shipments.

## P 294. Railroad passenger cars produced, 1871-1967.

Source: 1871-1914, see source for series P 17, pp. 14-15 and 196197; 1915-1957, see source for series P 295; 1958-1967, see source for series P 259.

For 1871-1919, figures represent domestic production of passenger cars, exclusive of that in railroad repair shops; thereafter, figures include production in railroad repair shops. For 1920-1957, figures represent "passenger train cars delivered."

Data for 1958-1967, which are from the census of manufactures, represent shipments.

## P 295. Railroad freight cars produced, 1871-1967.

Source: 1871-1914, see source for series P 17, pp. 14-15 and 193196; 1915-1919, American Railway Car Institute, Railway Age, Annual Statistical and Outlook Number, January 7, 1939, p. 83; 19201957, Railway Age, Annual Statistical and Outlook Number (most recently entitled Review and Outlook̆), various issues, 1950-1958 (copyright); 1958-1967, see source for series P 259.

For 1871-1919, figures represent domestic production of freight cars, exclusive of that in railroad repair shops; thereafter, figures include production in railroad repair shops. For 1920-1957, fgures represent "freight cars delivered."

Data for 1958-1967, which are from the census of manufactures, represent shipments.

## P 296-297. Horse-drawn vehicles produced, 1899-1967.

Source: 1899-1937, see Solomon Fabricant, p. 585, cited as source for series P 231; 1939-1967, see source for series P 259.

For 1899-1914, figures for farm wagons, trucks, and business vehicles include patrol wagons, ambulances, handcarts, and pushcarts; for 1919-1925, they exclude mail carrier wagons and public conveyances and relate to products made within the industry (as classified by the Bureau of the Census); for 1927-1967, figures relate to all products made regardless of the industry classification of the establishment.
For 1899-1925, figures for carriages, buggies, and sulkies exclude sulkies; for 1933, include two-wheeled carts.

## P 298. Bicycles produced, 1899-1967.

Source: 1899-1937, see Solomon Fabricant, p. 590, cited as source for series P 231; 1939-1967, see source for series P 259.

For 1899-1921, figures relate to products made within the industry (as classified by the Bureau of the Census); for 1923-1967, figures relate to all products made regardless of the industry classification of the establishment.

P 299-300. Pianos and organs produced, 1899-1967.
Source: 1899-1937, see Solomon Fabricant, pp. 597 and 598, cited as source for series P 231; 1939-1967, see source for series P 259.

For organs, series P 300, the data represent reed organs for 18991935, electronic organs thereafter.

## P 301-317. General note.

Capacity is rarely calculated on the basis of full-time operation of an industry (i.e., 365 days a year, 24 hours a day), but at varying criteria short of that. Capacity as of January 1 is generally used as the basis of computation. Exceptions to these general rules are noted in the text for each series, where applicable.

## P 301. Blast furnaces (pig iron), 1898-1960.

Source: American Iron and Steel Institute, Annual Directory and Annual Statistical Report, New York, various issues (copyright).
Figures include a 6.1 percent deduction from full-time operation to allow for rebuilding, relining, and repairing the equipment. Capacity is based on April 1 for 1898; November 1, 1901 and 1907; June 1, 1904; and the average of January 1 and July 1 for 1941-1944 and 1950.

None or negligible capacity in Alaska and Hawaii.
P 302. Steel ingots and steel for castings, 1887-1960.
Source: See source for series P 301.
Figures include a 9.1 percent deduction from full-time operation to allow for rebuilding, relining, and repairing equipment, and for holiday shutdowns. Capacity is based on an average of January I and July 1 for 1941-1944.

None or negligible capacity in Alaska and Hawaii.

## P 303. Copper refining, 1907-1970.

Source: 1907-1930, Edwin G. Nourse, America's Capacity to Produce, The Brookings Institution, Washington, D.C., 1934, p. 557; 1931-1970, American Bureau of Metal Statistics, Year Book, New York, various issues. (Copyright.)

None or negligible capacity in Alaska and Hawaii.

## P 304-305. Lead refining, 1921-1970.

Source: American Bureau of Metal Statistics, Year Book, New York, various issues (copyright).
None or negligible capacity in Alaska and Hawaii.

## P 306. Zinc refining, 1921-1970.

Source: See source for series P 304-305.
Figures are not comparable throughout because of changes in components. For 1921-1925, figures represent distillation zinc; 1926-1940, distillation and electrolytic zinc; 1941-1970, slab zinc. As an alternative source for data, see U.S. Bureau of Mines, Minerals Yearbook, various issues.
None or negligible capacity in Alaska and Hawaii.

## P 307. Alaminum ingots, 1889-1970.

Source: 1889-1895, J. D. Edwards, et al., The Aluminum Industry, McGraw-Hill Publishing Co., New York, 1930 (copyright); 19101919, U.S. Business and Defense Services Administration (now Bureau of Domestic Commerce), Materials Survey, Aluminum, 1956; 19271938, U.S. SurpIus Property Board, Aluminum Plants and Facilities Report, 1945; 1939-1970, American Bureau of Metal Statistics, Year Book, New York, various issues (copyright).

The general practice in this industry is to rate potline capacity
on full-time operation. As an alternative source for data, see U.S. Bureau of Mines, Minerals Yearbook, various issues.

None or negligible capacity in Alaska and Hawaii.

## P 308. Portland cement, 1910-1970.

Source: U.S. Geological Survey, 1910-1923, Mineral Resources of the United States, annual volumes; U.S. Bureau of Mines, 19241931, Mineral Resources of the United States, annual volumes; 19321970, Minerals Yearbook, annual volumes.

A deduction from full-time operation is taken for estimated average number of days required for repair or other unavoidable shutdowns. Favorable labor, fuel, and transportation conditions are assumed. No capacity in Alaska; figures include Hawaii beginning 1960.

## P 309. Crude petroleurn refining, 1918-1970.

Source: U.S. Bureau of Mines, 1918-1961, Petroleum Refineries, Including Cracking Plants in the United States, January 1, 1961 (also shown in Minerals Yearbook); 1962-1970, Mineral Industry Survey, Petroleum Refineries in the United States and Puerto Rico, January 1, annual issues.

Capacity is defined as the maximum daily average throughput (converted to an annual basis) of the plant in complete operation, with allowance for necessary shutdown time for routine maintenance, repairs, etc. It approximates the maximum daily average crude runs to stills that can be maintained for an extended period. Capacity is based on November 1 for 1924.

Includes Alaska for all years, Hawaii beginning 1960.

## P 310-311. Coke, 1909-1961.

Source: 1909-1920, see first source cited for series P 303; 1921-1961, see sources cited for series P 308.

None or negligible capacity in Alaska and Hawaii.

## P 312. Carbon black, 1928-1970.

Source: See source for series P 308.
None or negligible capacity in Alaska and Hawaii.

## P 313. Sulfuric acid, 1945-1970.

Source: 1945, reprinted with permission from Chemical and Engineering News, Washington, D.C., July 10, 1945 (copyright by American Chemical Society); 1950-1970, U.S. Bureau of Domestic Commerce (formerly Business and Defense Services Administration), Chemical Industry Report, various issues.

Capacity is based on 350 days a year.
None or negligible capacity in Alaska and Hawaii.

## P 314. Phosphatic fertilizers, 1900-1970.

Source: 1900-1951, U.S. Agricultural Research Service, Statistics on Fertilizers and Liming Materials in the United States, Statistical Bulletin No. 191, April 1957; 1952-1957, National Plant Food Institute, Plant Food Review, vol. 4, Nos. 2 and 3, 1958; 1958-1970, U.S. Bureau of Domestic Commerce (formerly Business and Defense Services Administration), unpublished data.

These data are the total of normal superphosphate, concentrated superphosphate, and miscellaneous phosphatic materials. Capacity of normal superphosphate is based on 300 two-shift days a year. Capacity of concentrated superphosphate and other phosphatic materials is based on 350 days a year, continuous operations.

None or negligible capacity in Alaska and Hawaii.

## P 315. Tatal combined nitrogen, 1924-1970.

Source: 1924-1950, see source for series P 314; 1951-1955, U.S. Business and Defense Services Administration, Summary Information on Anhydrous Ammonia, Bulletin No. 142, February 1956; 1956-

1970, U.S. Bureau of Domestic Commerce (formerly Business and Defense Services Administration), unpublished data.

This series was entitled "synthetic nitrogen" from 1924-1955. Capacity is based on 350 days a year, continuous operations.

None or negligible capacity in Alaska and Hawaii.

## P 316. Rayon and acetate yarn, staple and tow, 1911-1970.

Source: 1911, New York Times, Special Chemistry Section, September 2, 1951; 1931-1970, Textile Economies Bureau, Textile Organon (prior to 1952, Rayon Organon), New York, various issues. (Copyright.)

Data for 1931-1938 are for yarn only; stapie and tow data are not available for those years.

Capacity is as of November for all years except 1933 (July) and 1944 (April). Allowance was made for periodic shutdowns of machines for repair, overhaul, or cleaning on a set time schedule.

None or negligible capacity in Alaska and Hawaii.

## P 317. Paper and paperboard, 1900-1970.

Source: American Paper Institute, The Statistics of Paper, 1957, and subsequent annual issues, New York (copyright).

Historic capacity, used until 1955 , is based on 310 days a year, 24 hours a day, for paper and building paper and 313 days for paperboard. From 1956 to 1969, practical maximum capacity was used, based on 340 days a year for paper, 339 days for paperboard, and 326 days for construction paper and board and wet machine board. In 1970, practical maximum capacity was based on 346 days for all grades, 348 days for paper, 346 days for paperboard, and 334 days for construction paper and board and wet machine board,

Includes Alaska and Hawaii beginning 1960.
P 318-374. Value of output of finished commodities and construction materials destined for domestic consumption at current producers' prices, and implicit price indexes for major commodity groups (Shaw), 1869-1939.
Source: William H. Shaw, Value of Commodity Output Since 1869, National Bureau of Economic Research, New York, 1947, pp. 30, 66, and 290 (copyright).

These estimates are derived from census of manufactures data, supplemented by less complete data for nonmanufactured finished commodities and construction materials and for intercensal year interpolations. The estimates before 1919 are based necessarily on less adequate information.

The estimates of finished commodities measure the value of commodities that have reached the form in which they are used by ultimate recipients-largely households in the case of consumers' goods, chiefly business and public enterprises in the case of producers' goods. The amount "destined for domestic consumption" is derived as the sum of domestic production, minus exports, plus imports. In most years and for most commodities, the differences between domestic production of finished commodities and finished commodities destined for domestic consumption were modest. Changes in the latter, therefore, can be used as an approximate measure of changes in domestic manufacturing output. For figures on domestic output of finished commodities at producers' prices for 1919-1933, see Simon Kuznets, Commodity Flow and Capital Formation, vol. 1, National Bureau of Economic Research, New York, 1938, pp. 136-138 and 348.

The estimates presented here exclude transportation and distribution costs incurred after the production stage, and hence are not in terms of prices to final users. Nor do they measure domestic consumption for they make no allowance for inventory changes.

Perishable commodities include those usually lasting less than 6 months; semidurable, those usually lasting from 6 months to 3 years; and durable, those usually lasting more than 3 years. For a detailed discussion of sources and procedures, see the source, part II for estimates of the value of output, part III for exports and imports, and part IV for price indexes.

Series P 1-12. Manufactures Summary: 1849 to 1970

1 The Bureau of Labor Statistics annual averages for employment in manufacturing indicates 1943 as the year of maximum employment, with $15,147,000$ production wrikers. See series D 145 .
${ }^{2}$ For 1849-1933, cost of contract work was not subtracted from value of products in caleulating value added by manufacture. For $1935-1953$, value added by manufacture represents unadjusted value added; beginning 1954, it represents adjusted value.
${ }^{3}$ Except as noted, figures have been revised by retabulation of returns to exclude
data for establishments classified as data for establishoments classified as manufacturing in 1939 but as nonmanufacturing beginning 1947. Value added by manufacture in 1939, prior to revision and on a basis
eomparable with prior years, was $\$ 24.7$ bilion.

4 Includes establishments classified as manufacturing in 1939 and prior years but as nonmanufacturing thereafter.
${ }^{6}$ Figures revised on basis of estimates rather than by retabulation of 1939 reports. Estimates made as follows: For nonproduction employees, by multiplying the retabulated figure for number of production workers by the ratio of all employees to production workers computed from unrevised 1939 data; for salaries and wages, by multiplying the retabulated wage figure by the ratio for salaries and wages also derived from the unrevised 1939 data.
${ }^{6}$ Excludes data for salaried officers of corporations and their salaries; therefore, not strictly comparable with figures for other years.

Series P 13-17. Indexes of Manufacturing Production: 1860 to 1970

${ }^{2}$ Federal Reserve Board index of manufacturing production.
${ }^{8}$ Edwin Frickey's indexes of manufacturing production. in National Bureau of Economic Research index of physical volume, all manufacturing industries.

Series P 18-39. Indexes of Manufacturing Production (FRB), by Industry Group: 1947 to 1970 $[1967=100]$

| Year | Total manufacturing | Durable manufactures |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

${ }^{1}$ Beginning 1947, for food and kindred products, excludes driver-salesmen in bakery roducis indu
${ }^{2}$ Beginning 1954, includes milk bottling plants. Value added for this industry in 1954 was $\$ 1,476$ million.
${ }^{3}$ Beginning 1933, excludes establishments primarily engaged in manufacture of Beginning 1927, includes establishments primarily engaged in manufacture of vegetable cooking oils.

Series P 58-67. General Statistics for Manufacturing Industries, by Major Groups: 1899 to 1970—Con.

${ }^{1}$ Beginning 1958, excludes establishments primarily producing hats, except cloth and millinery, and those primarily producing hard-surface floor covering except asbestos, plastic, or rubber; therefore, data are not entirely comparable with those for eariier years. The 1957 employment was 12,428 for the hats except millinery industries and
8,736 for the hard-surface floor covering industry. Also, prior to 1958 , excludes estab-

[^129]Series P 58-67. General Statistics for Manufacturing Industries, by Major Groups: 1899 to 1970-Con.

Series P 58-67. General Statistics for Manufacturing Industries, by Major Groups: 1899 to 1970-Con.

1 For 1937-1947, excludes logging contractors and independent logging camps not operating sawmills as well as establishments primarily engaged in manufacture of venetian blinds.
2 For 1899-1929, excludes establishments primarily engaged in manufacture of wood and vehicle stock. For 1931, value added by manufacture on a basis comparable with 1929 is $\$ 523.8$ million; 1931 , on new basis, $\$ 524.4$ million.
${ }^{3}$ For 1899-1923, includes establishments engaged in manufacture of rules made of metal and other materials as well as wood; figures for later years inciude estahlishment making wooden rules only
${ }_{4}^{4}$ Beginning 1914, excludes establishments primarily engaged in manufacture of windows and door screens. For 1914, excludes establishments engaged in manufacture of laths and shingles; value added by manufacture on a basis comparable with prior years was $\$ 652$ million

Series P 58-67. General Statistics for Manufacturing Industries, by Major Groups: 1899 to 1970-Con.

[^130]4Beginning 1937, includes establishments primarily engaged in the manufacture
of fiber products, fiber conduits, and molded pulp products. In 1937 , value added by of fanufacture on a basis comparable with prior years was $\$ 853$ million.
5 Beginning 1931, includes establishments primarily engaged in manufacture of papeteries. In 1931, value added by manufacture on a basis comparable with prior years was $\$ 600$ million.
${ }_{6}$ Prior to 1947 , includes establishments primarily engaged in the manufacture of tags.

Series P 58-67. General Statistics for Manufacturing Industries, by Major Groups: 1899 to 1970--Con.

[^131]basis comparable with prior years was $\$ 1,759$ million. Also beginning 1937, excludes woods employees of the gum naval stores industry; in 1937, production workers numbered 30,880 with wages of $\$ 8.6$ million.
7 Beginning 1933, includes establisinments primarily engaged in manufacture of ethyl alcohol.
${ }^{8}$ Beginning 1929 , excludes establishments other than petroleum refineries engaged in manufacture of lubricating oils.
veginning 1927 , excludes establishments primarily engaged in manufacture of vegetable cooking oils.
of rubiger cement, excludes certain establishments primarily engaged in manufacture of rubber cement. In 1925, value added by manufacture on a basis comparable with prior years was $\$ 1,321$ milion. In 1904, value added by manufacture on a basis comparable with 1899 was $\$ 287$ million.

Series P 58-67. General Statistics for Manufacturing Industries, by Major Groups: 1899 to 1970 -Con.

${ }_{2}{ }_{2}$ Beginning 1954, excludes beehive and byproduct coke ovens. ${ }^{2}$ For 1947 , excludes byproduct coke plants operated in conjunction with public engaged in shipping lubricants and greases made from animal and vegetable oils. such modity group.
modity group.
4 For 1935 , excludes a féw establishments primarily engaged in blending and compounding lubricating oils.
${ }^{5}$ Beginning 1929, excludes lubricants not elsewhere classified and paving mixtures and blocks. In 1929, these industries represented 4 percent of the production workers and 5 percent of the value added by manufacture for this commodity group.
5 For 1899 and 1904, excludes fuel briquets and roofing felts and coatings. In 1909 these industries represented 6 percent of the production workers and 9 percent of the value added by manufacture for this commodity group.
${ }^{7}$ Beginning 1958 , includes establishments engaged in molding plastics products for the trade and fabricating miscellaneous finished plastics products.

Series P 58-67. General Statistics for Manufacturing Industries, by Major Groups: 1899 to 1970—Con.

Series P 58-67. General Statistics for Manufacturing Industries, by Major Groups: 1899 to 1970—Con.

1 For 1939, 1947, and 1954, excludes establishments primarily engaged in producing ready-mixed concrete. In 1958 , the value added in such establishments represented 12 percent of the total value added for this commodity group and, in 1937, less than 1 percent. The value added at quarries operated in conjunction with manufacturing establishments (including value added in producing mineral products consumed in the same establishment) was $\$ 194$ million in 1954, $\$ 361$ million in 1958 , and $\$ 321$ million in 1963.
Beginning 1954, includes beehive and byproduct coke ovens.
${ }^{3}$ For 1937, includes establishments primarily engaged in producing certain nonferrous bearings and aluminum products (ship bunks, ornamental metal work, stampings, novelties, valves and fittings, machined castings and tags) and excludes establishments primarily engaged in making electrometallurgical products, nonferrous die castings and forgings, cast aluminum cooking ware, and in the heat treatment of steel.
In 1939 , value added by manufacture on a basis comparable with 1937 was $\$ 2,131$ million.

Series P 58-67. General Statistics for Manufacturing Industries, by Major Groups: 1899 to 1970-Con.

${ }^{1}$ For 1937, excludes establishments primarily engaged in producing lawn sprinklers, sun ware nonterrous metal noveltes, tackle blocks aluminum ornamental work aluminum stempings, and machine knives (except metalworking) and includes establishments primarily engaged in making caulking guns, toilet seats, brooders, cast aluminum cooking ware, and hair clippers. In 1939, value added by manufacture on a basis comparable with 1937 was $\$ 1,340$ million.

Includes electrical machinery.
${ }^{3}$ For 1937, includes establishments primarily engaged in manufacture of thermostats and gauges, heat treating of steel, machine knives, and tackle blocks, and excludes establishments primarily engaged in manufacture of vacuum cleaners, turbo-generators and water-wheel generator sets, hair clippers for animal use, brooders, nonferrous bearings, certain industrial furnaces and ovens, time-stamps and time-recording machines, dictating machines, certain valves and fittings (except plumbers', ${ }^{\text {and }}$
caulking guns. In 1939 , value added by manufacture on a basis comparable with caulking guns. In 1939,
1937 was $\$ 1,990$ million.

${ }^{1}$ Beginning 1958, includes establishments primarily engaged in manufacture of household refrigerators and home and farm freezers; household laundry equipment and sewing machines; water heaters, except electric; and other household appliances. Excludes those primarily engaged in manufacture of hearing aids; high frequency, induction, and dielectric heating apparatus; commercial food warming equipment;
industrial electric heating units and devices; and insulated wire and cable made from purchased wire. ${ }^{2}$ Included with machinery, except electrical.
 electric (dry) shavers.
${ }^{4}$ Beginning 1939, excludes establishments primarily engaged in manufacture of vacuum cleaners, turbo-generators and water-wheel generator sets, dictating machines on a basis comparable with prior years was $\$ 1,000$ milion
${ }^{3}$ Beginning 1935, excludes establishments primarily engaged in manufacture of certain types of beauty and barber shop equipment. teginning 1927, excludes estabishments primarily engaged in manufacture of certain types of mechanical refrigerators. ${ }^{7}$ Beginning 1909 , excludes establishments primarily engaged in manufacture of signs and advertising noveities
${ }^{8}$ Beginning 1958, includes establishments primarily engaged in manufacture of truck and bus bearings, convertible tops for automobiles, rebuilt automotive parts, and aircraft and related engine and power take-off gears and excludes those primarily engaged in manufacture of parachutes. on a basis comparable with 1937 was $\$ 1,794$ moillion.

${ }^{1}$ Beginning 1958，includes establishments primarily engaged in manufacture of laboratory precision balances，laboratory furniture，revolution counters，operating room naty
${ }_{3}$ For 1947 and 1954－1970 includes establish naphs and
automatic temperature controls．
hermostats and gauges and excludes thents primarily engaged in manufacture of recording stamps and machines．In 1939，value added on a basis comparable with prior years was $\$ 314$ million．
${ }^{4}$ Beginning 1937，includes establishments primarily engaged in manufacture of certain mechanical measuring instruments．In 1937，value added by manufacture on a basis comparable with prior years was $\$ 295$ million．
${ }^{5}$ Beginning 1935，includes establishments primarily engaged in manufacture of certain dental equipment and supplies（chairs，cabinets，and electrical devices）．
${ }^{0}$ Beginning 1929，excludes establishments primarily engaged in manufacture of gas machines．In 1929 ，value added by manufacture on a basis comparable with prior years was $\$ 306$ million．${ }^{7}$ Beginning 1927，excludes dental laboratories operating on a custom basis．${ }^{\text {In }}$ in 192 ，
${ }_{8}^{\text {prior }}$ Beginning 1925 ，excludes establishments primarily engaged in grinding lenses for spectacles and eyeglasses to individual prescription．
spectacles and eyeglasses to individual prescription．
Beginning 1914 ，includes establishments primarily engaged in manufacture of motion－picture machines．In 1914，value added by manufacture on a basis comparable with prior years was $\$ 96$ million．${ }^{10}$ Includes ordnance．
with prior years was ${ }^{11}$ Beginning 1958 ，excludes establishments primarily engaged in manufacture of plastics products not elsewhere classified，cork products，soda－fountain and bar equip－ ment，and jewelry，instrument，and musical instrument cases and includes those pri－ marily engaged in manufacture of linoleum and other hard surface floor covering，n．e．c． ${ }_{12}$ Prior to 1955 ，includes ordnance and accessories．

NA Notavailable.
${ }^{1}$ Covers factories having annual production of $\$ 5,000$ or more.
${ }^{2}$ Some minor groups are not adjusted for investment in emergency facilities after "normal" depreciation or intangible assets. Therefore, sum of detail does not equal totals.
${ }^{3}$ Includes firms engaged in shipbuilding which were exciuded in other years.
Covers factories having annual production of $\$ 500$ or more.
Inciudes custom and neighborhood shops.

Series P 177-180. Share of Total Value Added by Manufacture Accounted for by the 200 Largest Manufacturing Companies: 1947 to 1970

See footnotes at end of table.

Series P 231-300. Physical Output of Selected Manufactured Commodities: 1860 to 1970-Con.

* Denotes first year for which figures include Alaska and Hawaii.
- Represents zero. NA Not available. $Z$ Less than 500 short tons.

Figures for 1915-1929 are for crop years ending June; all others are for calendar years. The 1914 crop year figure is 114.2 million barrels. The 1929 calendar year tigure is 120.0 miltion
ears ending June 30
${ }^{3}$ Prior to 1959 , shortening only; figures for salad and cooking oils not collected.
Includes large and small sizes.
Data for 53 weeks.
${ }_{2}^{6}$ Includes boys' uniform clothing.
${ }_{8}{ }^{2}$ Excludes separate coats.
9 Alcoholic content limited to 3.2 percent by weight from Apr. 7-Dec. 5, 1933.
10 Includes 1,589 thousand barrels produced prior to Apr. 7 (effective date of the Act of Mar. 22, 1933).
in From beginning of series through 1939, represents amount produced.
${ }^{12}$ Beginning 1964, includes kerosene type jet fuel.
${ }_{13}{ }^{23}$ Tufted only.
${ }^{14}$ Represents only reported quantities produced; not adjusted to include estimated production for establishments not reporting.
${ }^{15}$ For 1939-1949, excludes flakes and powders; for 1939-1942, also excludes solids.
${ }^{16}$ A mount for sale.
${ }^{17}$ Beginning 1959, includes Hawaii.
${ }^{18}$ Beginning 1953, includes production by basic oxygen process, not shown separately here.
${ }^{19}$ Represents shipments of heavy steel structural shapes; comparable figure for 1968 is 5,557 thousand.
${ }^{20}$ Represents shipments of steel products; comparable figure for 1968 is 91,856 thousand.
${ }_{22}^{22}$ Bessemer included with open hearth.
${ }^{22}$ Includes bicycle tires.
${ }_{24}^{23}$ Excludes motorcycle tires.
${ }_{25}$ Prior to 1961 , represents thousands of short tons of metal consumed in manufacture of cans. Comparable figure for 1961 is 5,039 thousand.
${ }^{26}$ For October-December, excludes standard portable typewriters and specialized typewriters (i.e., specialized composing typewriters, coded media typewriters, and input/output typewriters)
${ }^{27}$ Represents tinpiate cans shipped.
${ }_{28}$ Excludes other than free-standing ranges.
${ }_{28}$ Excludes specialized typewriters.
${ }^{30}$ Listed as self-contained window sill type.
${ }_{31}$ Amount produced.
${ }_{23}^{32}$ Represents orders booked rather than shipments; comparable figure for 1944 is 226 thousand.
${ }_{33} 21 / 2 \mathrm{kw}$. and over.
${ }^{3}$ Represents sales.
${ }_{36} 35$ Includes disk stoves and hotplates.
${ }_{36}$ Includes rebuilt locomotives.
${ }_{37}$ Represents shipments. For bicycles, 1963 and 1967, excludes children's 2 -wheel sidewalk cycles with semipneumatic tires.
${ }^{38}$ Civilian only.
${ }^{39}$ For phonographs, amount produced, 1921-1929. Radio-phonograph combina-
ions included with phonographs, 1919-1925.
40 Not strictly comparable with later years because of changes in classification.
${ }^{4} 1$ Represents electronic organs shipped.

Series P 301-317. Total Production Capacity of Selected Manufacturing Industries: 1887 to 1970 [In thousands of short tons unless otherwise stated. Capacity is usually rated as of January 1. See text for exception]

## Transportation

# Highway Transportation (Series Q 1-263) 

## Q 1-263. General note.

In 1894, the Federal Government created an Office of Road Inquiry to initiate experiments and conduct inquiries concerning the best methods of road building. It was succeeded by the Office of Public Roads and Rural Engineering in 1916 and by the Bureau of Public Roads in 1918 (the latter was called the Public Roads Administration during 1939-1949). The bureau was transferred to the Department of Transportation in 1966 and its functions assigned to the Federal Highway Administration. Surveys of highway mileage, revenues, and expenditures were made in 1904, 1909, and 1914.

In 1916, Congress passed the first of the many Federal-aid highway acts, under which the Federal Government has contributed to the cost of constructing highways designated as parts of the Federal-aid system. The Federal Highway Administration administers Federal legislation providing for the improvement, in cooperation with the States, of roads on the Federal-aid primary, secondary, and interstate highway systems. As the principal road-building agency of the Federal Government, it also cooperates with the Forest Service, the National Park Service, and other Federal agencies in the construction of roads in national forests, parks, and other areas.

The principal sources (1973) of data on public roads and on ownership and operation of motor vehicles is the Federal Highway Administration's annual Highway Statistics and its Highway Statistics, Summary to 1965. Another major source of data is the Interstate Commerce Commission. Among its publications are the monthly Transport Economics and the Annual Report, containing data on all types of domestic transport and the annual Transport Statistics in the United States.

Various censuses conducted by the U.S. Bureau of the Census also provide data relating to transportation. Reports of the census of manufactures and the census of business and the Annual Survey of Manufactures present statistics on the motor vehicle and equipment industry and on retail, wholesale, and services aspects of this industry.

Q 1-11. Volume of domestic intercity passenger traffic, by type of transport, 1950-1970.
Source: U.S. Interstate Commerce Commission, Annual Report and Transport Economics, various issues.

Q 12-22. Volume of domestic intercity freight traffic, by type of transport, 1939-1970.

Source: U.S. Interstate Commerce Commission, 1939-1959, Intercity Ton-Miles, 1939-1959, Statement No. 6103; 1960-1970, Annual Report and Transport Economics, various issues.

This study is intended to show, on as nearly comparable a base as possible, the intercity ton-miles by the various means of transport. Information sufficient in quantity and accuracy is not available to cover all modes of transport on a comparable basis before 1939. Estimates of intercity ton-miles for a period from sometime before 1939 through part of World War II are contained in the Bureau of Transport Economics and Statistics release, Postwar Traffic Levels, Statement No. 4440, issued in 1944. These estimates, however, are not on bases comparable with those in the 1939-1959 series.

A ton, as used here, is 2,000 pounds; and a mile is 5,280 feet. A
ton-mile is a ton of freight carried one mile. These definitions apply to all means of transport covered. To this extent, all figures presented here are comparable. Further, as far as possible, local switching, local delivery, lighterage, and rural to rural movements have been eliminated to confine operations to intercity only.

Q 23-35. Operating revenues, by type of transport, 1936-1970.
Source: Except for series Q 28, U.S. Interstate Commerce Commission, 1936-1956, Statistics of Class I, II, and III Motor Carriers, 1989-1956, Statement No. 589; 1957-1970, Annual Report and Transport Economics, various issues, and unpublished data. Series Q 28, U.S. Federal Aviation Administration, FAA Statistical Handbook of Aviation, various editions.

Q 36-46. Employment in selected types of transportation, 1947-1970.
Source: U.S. Bureau of Labor Statistics, Employment and Earnings, United States, 1909-72, Bulletin 1312-9, pp. 526-532.

Q 36, total. Represents about 80 percent of all employment in transportation. Data for types of transportation other than those shown here are available in the source only for shorter and current periods.

## Q 47-49. Indexes of transportation output, 1889-1966.

Source: 1889-1946, National Bureau of Economic Research, New York, Harold Barger, The Transportation Industries, 1889 to 1946 (copyright); 1947-1966, estimates by John W. Kendrick, George Washington University.

Sources of figures and methods of computation are described in Barger's book. The components of passenger traffic, series Q 48, are airlines, intercity buslines, waterways, and steam railroads. For freight traffic, series Q 49, the components are motor trucking, pipelines, waterways, and steam railroads.

## Q 50-55. Mileage of rural roads and municipal streets, 1904-1970.

Source: U.S. Bureau of Public Roads, 1904-1920, Highway Statistics, Summary to 1955. U.S. Federal Highway Administration, 1921-1965, Highway Statistics, Summary to 1965; 1966-1970, Highway Statistics, annual issues.

Rural roads are defined roughly as those roads located outside of incorporated communities or delimited places generally having more than 1,000 inhabitants. Estimates for earlier years for total mileage of rural roads are (in thousands of miles): 1904, 2,151; 1909, 2,200; 1914, 2,446.

Municipal and other mileage figures for 1934 and 1935 represent only mileage on municipal extensions of State systems, which are State administered. Mileage not on State or county systems was initially included in 1936 ( 67,000 miles). Mileage on lo cal city streets was first included in 1941 ( 274,000 miles for that year). Municipal extensions are continuations of State System roads through communities with more than 1,000 inhabitants. Although mileage in places having more than 2,500 inhabitants was not originally included in Federal-aid programs, those places have been eligible for such aid in more recent years.

Q 56-58. Surfaced mileage, 1904-1970.
Source: 1904-1940, see first source for series Q 50-55; 1941-1970, see other sources for series Q 50-55.

High-type surfaced roads include bituminous penetration, sheet asphalt, bituminous concrete, portland cement concrete, vitrified brick, and block pavements of asphalt, wood, and stone. For some years, they also include dual-type surfaces and a small amount of unclassified mileage. Low-type surfaced roads include sand, clay, selected soil, untreated gravel, bituminous surface-treated, mixed bituminous and treated gravel, chert, shale, waterbound macadam.
Q 59-63. Mileage built by State highway departments, 1923-1970.
Source: 1920-1933, see first source for series Q 50-55; 1934-1970, see other sources for series Q $50-55$.

Mileage built is mileage on which construction work creates a newly located road or is regarded as significantly improving the condition of an existing road. It does not include work designed to maintain or restore the condition of an existing road without material betterment. Mileage resurfaced or rebuilt to higher standards is the bulk of mileage built. Construction of earth roads consists of aligning, grading, and draining. See also text for series Q 56-58.

## Q 64-68. Mileage and cost of Federal-aid highway systems, 1917-

 1970.Source: Series Q 64, U.S. Federal Highway Administration, 19281965, Highway Statistics, Summary to 1965; 1966-1970, Highway Statistics, annual issues. Series Q 65-68, U.S. Bureau of Public Roads, 1917-1955, Highway Statistics, Summary to 1955; 1956-1965, Highway Statistics, annual issues; 1966-1970, see source for series Q 64.

In 1912, the Congress authorized $\$ 500,000$ for an experimental program of rural post-road construction. However, it was not until the Federal-Aid Road Act of 1916 that the present cooperative Federal-State highway program was established on a continuing basis. In order to accelerate the improvement of the main traveled roads, Congress in 1921 authorized designation of a system of principal interstate and intercounty roads, limited to 7 percent of the total rural mileage then existing. The use of Federal aid was restricted to this system, and to rural mileage only.

Urban highway improvement first came in for its share of the Federal-State program when the Federal-Aid Highway Act of 1944 specifically authorized the use of funds for Federal-aid highways in urban areas. In addition, the Act provided for the designation of a Federal-aid secondary system and a National System of Interstate Highways. The Federal-Aid Highway Act of 1956 provided substantially increased sums for the Federal-aid primary and secondary systems for a 3 -year period, and established a long-range plan for financing accelerated completion of the 41,000 -mile interstate system.

Federal funds are available for expenditure only on the designated Federal-aid systems and, in general, must be matched by an equal amount of State funds. However, under the Federal-aid Act of 1954 the Federal share for the Interstate System was raised to 60 percent, and under the 1956 Act the proportion was increased to 90 percent. Federal aid may not be expended for maintenance. The cost of most Federal-aid projects is paid initially out of State highway funds, or in some cases by counties or other local governments. The Federal share is paid as reimbursement to the States as work progresses, with final payment made after completion.

Federal authorizations have usually been made on a biennial basis and apportioned among the States for use within a 3 -year period. Figures for State funds shown here are based on legal matching ratios determined by applicable Federal-aid acts. In States having public lands in excess of 5 percent of their total area, the Federal share is proportionally increased.

## Q 69-81. Class I intercity motor carriers of passengers and property, 1939-1970.

Source: U.S. Interstate Commerce Commission, Transport Statistics in the United States, part 7, annual issues.

Prior to 1950, class I for-hire motor carriers were classified by the Interstate Commerce Commission as those with $\$ 100,000$ or more of gross annual operating revenue; for 1950-1958, those having gross operating revenue of $\$ 200,000$ for a 3 -year period; and, beginning 1969, those having gross operating revenue of $\$ 1,000,000$ for a 3 -year period.

## Q 82-96. State highway finances, 1890-1970.

Source: 1890-1920, see first source for series Q 50-55; 1921-1970, see other sources for series Q $50-55$.

A State highway-user tax is defined as a special tax or fee (except tolls) levied upon motor-vehicle users because of their use of the highways. Highway-user taxes include motor-fuel taxes, motorvehicle registration and associated fees, and special taxes applicable only to motor carriers; these taxes are separable and apart from property, excise, business, or other taxes paid by the general public.
In many States, specific portions of the revenue from each type of highway-user tax are allocated to particular highway purposes. A number of States, however, place all highway-user revenue in a highway fund, and a few have a general State fund into which go all types of revenue. For the latter group of States, each particular appropriation or expenditure for highway purposes is considered to have been made from motor-fuel taxes, motor-vehicle registration fees, and motor-carrier taxes in proportion to the relative amount of revenue received from each of these three sources.
The largest share of receipts from State highway-user taxes is expended on State highways, but a portion is also allocated for local roads and streets, and a small amount used for nonhighway purposes.

## Q 97-112. Receipts and disbursements of highway funds by counties and townships, 1921-1970.

Source: U.S. Federal Highway Administration, 1921-1964, Highway Statistics, Summary to 1965, tables LF-201 and LF-202; 19651970, Highway Statistics, annual issues, tables LF-1 and LF-2.

Q 113-128. Receipts and disbursements of highway funds by municipalities, 1921-1970.
Source: U.S. Federal Highway Administration, 1921-1964, Highway Statistics, Summary to 1965, tables UF-201 and UF-202; 19651970, Highway Statistics, annual issues, tables UF-1 and UF-2.

## Q 129-135. Highway construction-contracts awarded, 1947-1970.

Source: U.S. Bureau of Domestic Commerce (formerly Business and Defense Services Administration), Construction Review, various issues.

Highways include streets, roads, alleys, bridges, vehicular tunnels, viaducts, sidewalks, curbs, and gutters, except when installed by private builders as a part of land development; forest and park roads; new culverts and extension of old culverts; right-of-way drainage, erosion control, lighting, and guard rails; and earth-work protective structures in connection with road improvements.

The data for State and locally owned highways were compiled by the Bureau of Domestic Commerce (formerly the Business and Defense Services Administration), Department of Commerce, from: (1) Information published by a number of private construction news services; (2) information received from selected State and local government agencies; and (3) data compiled by the Bureau of Public Roads (now the Federal Highway Administration) and the Bureau of Labor Statistics.

Data on contracts awarded for federally owned construction were compiled by BLS from reports submitted by the various Federal agencies having construction operations.

Q 136-147. Public highway debt-long-term highway obligations of State and local governments, 1945-1970.
Source: U.S. Federal Highway Administration (formerly Bureau of Public Roads), releases.

## Q 148-151. Motor-vehicle factory sales, $1900-1970$.

Source: Automobile Manufacturers Association, Automobile Facts and Figures, various issues.

Production of passenger cars was discontinued in February 1942 to economize resources for World War II purposes, but some vehicles remaining in factory stocks were sold under rationing orders in subsequent war years. The War Production Board authorized resumption of production as of July 1, 1945, but no new cars were actually produced until 1946.

## Q 152-155. Motor-vehicle registrations, 1900-1970.

Source: U.S. Federal Highway Administration, 1900-1965, Highway Statistics, Summary to 1965; 1966-1970, Summary of Motor Vehicle Registrations by Years, table MV-200, and unpublished data.

Figures are based on reports and unpublished data of State motorvehicle registration departments. They include both privately and publicly owned vehicles.

Motor-vehicle data for the early years of the century are incomplete, largely because few States required their registration, and hence had no records of the number of vehicles using roads and streets. As production of vehicles increased, shortly before the first World War, so did the number of registration laws. By 1921, all States had adopted some form of motor-vehicle registration.

Accompanying the growth in motor-vehicle registrations has been a corresponding diversity in the registration practices among the States. In general, motor vehicles are classified as private passenger cars, passenger carriers for hire, trucks, trailers, motorcycles, and property carriers for hire. Several States, however, still register buses with either trucks or passenger cars. These differences have made it necessary for the data-compiling agency to supplement the data submitted by the States with information obtained from special studies and from other sources.

## Q 156-162. Motor-fuel usage, 1919-1970.

Source: U.S. Federal Highway Administration, 1919-1965, Highway Statistics, Summary to 1965; 1966-1970, Analysis of Motor Fuel Consumption, table G221, and unpublished data.

Fuel consumption figures for which reports from State authorities were not available have been estimated by the Federal Highway Administration (formerly Bureau of Public Roads). Motor fuel includes all gasoline used for any purpose (private and public), except military, plus any diesel or other fuels used solely for the propulsion of motor vehicles on public highways. Exports from the United States are excluded, and there is no duplication because of interstate shipment. Tractor fuels are not included. Nonhighway consumption includes all use off the highway, such as aviation, agriculture, marine, industrial, etc., and usually falls under the exemption or refund provisions of the motor-fuel tax law.

## Q 163-174. Automobile insurance, 1946-1970.

Source: The Spectator, Philadelphia, 1946-1954, Insurance Yearbook; 1955-1965, Insurance by States; 1966-1969, Property Liability Insurance Review, annual. 1970, The National Underwriter Co., Cincinnati, Argus F.C. \& S. Chart, annual (copyright).

Q 175-186. Percent distribution of automobile ownership, and financing, 1947-1970.
Source: The University of Michigan, Survey Research Center, Ann Arbor, Survey of Consumer Finances (copyright).

Q 187-198. Speed of motor vehicles on highways, 1945-1970.
Source: U.S. Federal Highway Administration, Traffc Speed Trends, and unpublished data.
Comparatively few speed studies were conducted on main rural highways until immediately prior to World War II. At that time, the average speeds of trucks, passenger cars, and buses were 41, 48, and 51 miles/hour, respectively. The low average speeds during World War II resulted from wartime restrictions on travel speeds and from gasoline rationing.
Speeds of passenger cars did not return to their prewar level until 1947. Trucks reached their prewar level in 1946, and buses in 1948. From 1948 through 1950 there was little change in vehicle speeds. Since then speeds consistently increased until 1970.

## Q 199-205. Miles of travel by motor vehicles, 1921-1970.

Source: 1921-1935, U.S. Federal Works Agency, unpublished data, and U.S. Public Roads Administration, unpublished data; 1936-1965, see U.S. Federal Highway Administration sources for series Q $50-55$.

Traffic volume information is obtained from automatic traffic recorders operating continuously at selected locations on the roads and streets of each State. The recorders are generally supplemented by periodic manual classification counts to determine the proportion of vehicles of each type, and each highway category, and by portable machine counts on the many road and street sections.

## Q 206-207. Average miles of travel per vehicle, 1936-1970.

Source: See U.S. Federal Highway Administration sources for series Q $50-55$.

## Q 208-223. Motor-vehicle deaths and death rates, by age, 1913-1970.

Source: National Safety Council, Chicago, Accident Facts, 1969, p. 60 ; and 1974, p. 60 (copyright).

Data for 1913 to 1932 were calculated from U.S. National Center for Health Statistics data for registration States. Data for 1933 to 1963, 1965 to 1967, 1969, and 1970 are national totals; those for 1964 and 1968 are National Safety Council estimates.

Q 224-232. Motor-vehicle accidents-number and deaths, by type of accident, 1913-1970.

Source: National Safety Council, Chicago, Accident Facts, 1974, and various annual issues (copyright).

## Q 233-234. State and Federal gasoline tax rates, 1930-1970.

Source: See U.S. Federal Highway Administration sources for series Q 50-55.

State average tax is weighted by net gallons taxed at the various rates in the several States. No data are shown before 1930 because it was the first year in which all States had motor fuel taxes in effect for the whole year.

The precise dates of the changes in the Federal tax are as follows: June 21, 1932, 1 cent; June 17, 1933, 1.5 cents; January 1, 1934, 1 cent; July 1, 1940, 1.5 cents; November 1, 1951, 2 cents; July 1, 1956, 3 cents; October 1, 1959, 4 cents.

Q 235-250. Public transit mileage, equipment, passengers, and passenger revenue, 1917-1970.
Source: American Transit Association, Transit Fact Book, various annual issues (copyright); The Transit Industry in the United States, Basic Data and Trends, 1943 (copyright); mimeographed release on number of passengers, January $3,1938$.

Figures are estimates based on reports for more than 85 percent of the industry, which includes local motorbuses, electric street railways, elevated and subway lines, interurban electric railways, and transit coach lines.

Mileage estimates for trolley coaches, series Q 236, are miles of negative overhead wire. Mileage estimates for motorbuses, series Q 237, are miles of route, round trip. Equipment owned, railway cars, series Q 238, includes surface, subway, and elevated cars. The estimates for 1933 and 1934 for motorbuses owned, series Q 240, are probably understated. Revenue and nonrevenue passenger figures, series Q 241-244, exceed revenue passenger figures, series Q 245 , chiefly because of free transfers.
Q 251-263. Oil pipelines operated and oil originated, 1921-1970.
Source: U.S. Interstate Commerce Commission, 1921-1953, Sta-
tistics of Railways in the United States, various annual issues; 19541970, Transport Statistics in the United States, part 6, Oil Pipe Lines.
Figures refer to pipelines operating in interstate commerce and regulated by ICC. Crude oil originated, series Q 252, includes both gathering and trunk lines.

For a discussion of statistics of oil pipelines, see ICC, A Review of Statistics of Oil Pipe Lines, 1921-1941, Statement 4280, mimeographed, 1942. The figure for mileage in 1938, which appears to have been revised, is from this Statement.

Figures for barrels of oil carried are as follows, in millions: 1925, 831; 1926,$836 ; 1927,989 ; 1928,1,053 ; 1929,1,156 ; 1930,1,172 ; 1931,987$. In these figures, a barrel handled by two or more pipelines in succession is counted each time it is handled. In the figures for barrels originated, this duplication is avoided.

Series Q 1-11. Volume of Domestic Intercity Passenger Traffic, by Type of Transport: 1950 to 1970
 movement of 1 passenger for the distance of 1 mile. Comprises public and private traffic, both revenue and nonrevenue]

* Denotes first year for which figures include Alaska and Hawaii.
${ }^{1}$ The electric railway decrease is overstated through the years because of noncomparability of reporting.
${ }_{2}$ Through 1969, excludes payments to others for express privileges.
${ }^{3}$ Includes puilman (prior to 1965), line-haul, and switching and terminal companies.
${ }^{4}$ Includes only revenues from domestic traffic of carriers under jurisdiction of Interstate Commerce Commission.
${ }^{5}$ Revenues for scheduled passenger cargo operations.
${ }_{6}^{6}$ Includes Hawaii for all years and Alaska beginning 1955.
7 Beginning 1960, includes operations in Alaska.

* Denotes first year for which figures include Alaska and Hawaii.

1 Includes estimates on Federal-aid primary system throughout, Federal-aid secondary systems beginning in 1942, and national system of interstate and defense highways beginning in 1951. Estimates as of end of calendar year.

Comprises new and rebuilt mileage.
${ }^{3}$ Represents actual expenditures of funds on calendar-year basis. Beginning 1935, includes money spent on public works and defense highways. Beginning 1940, includes secondary highways.

- Represents zero.
${ }_{2}^{2}$ Beginning 1940 , includes small amount from municipalities, not shown separately.
${ }^{2}$ Beginning 1940, includes smal amount from municipalities, not shown separately. 1933-42 respectively, as follows (in millions of dollars): 25, 150, $91,339,221,389,352$, 295, 189, and 78.

4 Includes expenditures by local rural agencies for highways. The major share of the expenditures were for the local highway system. However, in some instances, outlays for State-administered highways and local city streets are included.
${ }_{5}$ For 1931-1959, includes small amount for nonhighway purposes, not shown separately. ${ }^{\text {Includes }}$ debt service for long and short-term notes. The latter are for two years or less.

Series Q 113-128. Receipts and Disbursements of Highway Funds by Municipalities: 1921 to 1970
[In millions of dollars]

[^149]
# Rail Transportation (Series Q 264-412) 

## Q 264-412. General note.

The principal sources of these series are various issues of two annual publications of the Interstate Commerce Conmission: For 19541970, Transport Statistics in the United States, part 1; and for all years prior to 1954, Statistics of Railways in the United States.
No attempt has been made to adjust the figures for the effect of changes in methods of accounting and reporting; hence, the data for the various years are often only approximately comparable.

Although railroads regulated by the ICC are still described legally as "steam railways," most train and switching operations, since 1957, are performed by diesel locomotives, and some divisions of the railways included are electrified. The Commission has also regulated a small and diminishing number of railways of the interurban electric type which are not included in the figures shown here.

Railway operating companies are those whose officers direct the actual transportation service and whose books contain operating as well as financial accounts. Lessor companies maintain a separate legal existence, but their properties are operated by the lessees. Proprietary companies are also nonoperating companies. Their outstanding capitalization is owned by other railway companies. The term "circular" refers to roads (operating or nonoperating) for which brief circulars showing date of incorporation, mileage, and a few other facts were filed with the Interstate Commerce Commission. They include intrastate roads and roads under construction. The term "unofficial" is used to indicate roads for which official returns were not received by the ICC-the figures having been taken from the returns by roads in prior years, and items contained in railway and engineering periodicals and newspapers, corrected in accordance with the best information available.

Switching and terminal companies are those operating separately for joint account or for revenue. Services such as those of switching and terminal companies are mostly performed directly by the line-haul carriers as an ordinary part of their business. Line haul denotes train movements between terminals and stations on main and branch lines of the road, exclusive of switching.

Beginning in 1911, the ICC classified operating companies on the basis of operating revenues. Those of class I had annual revenues above $\$ 1,000,000$; class II, above $\$ 100,000$; and class III, below $\$ 100,000$. Beginning in 1956, the minimum for class I was raised to $\$ 3,000,000$ and the other two classes were consolidated. Effective January 1965, the classification was changed to the following: Class I, $\$ 5,000,000$ or more; and class II, under $\$ 5,000,000$. If the revenues of a company fall below the limit, the company is not reclassified until the decline appears to be permanent. The relative importance of class I railroads has increased since 1911 because of the growth of traffic and the absorption of small roads in larger systems. The ratio of operating revenues of class I line-haul companies to the total revenues of classes I, II, and III was 96.48 percent in 1911, 97.45 in 1916, 98.07 in 1926, 98.76 in 1941, 99.06 in 1945, and 98.21 in 1969.

A collection of definitions of words or phrases frequently used in discussions of railway statistics has been issued by the ICC, entitled Railway Statistical Terms, Statement No. 4119, June 1941. For financial terms, see ICC, Uniform System of Accounts for Sieam Railroads.
Statistics of mileage in existence and stocks of equipment, and balance sheet items, pertain to the end of the year indicated.

There are no class I railroads in Alaska or Hawaii.
Q 264-273. Electric railways-summary, 1890-1937.
Source: U.S. Bureau of the Census, Census of Electrical Industries, Report on Street Railways and Trolley-Bus and Motorbus Operations.

The census of street railways, which was first taken in 1890, and which was taken at quinquennial intervals from 1902 through 1937, covers all street railways, without regard to kind of motive power, and all interurban railways using other than steam as motive power. The nonelectric railroads included are those operated principally by cable and gasoline engines. Operations of electrified divisions of steamrailway companies are not included. Figures in these series do not include data for motorbus and trolley-bus operations of electric street railways. For motorbus and trolley-bus statistics from census reports, see source.

## Q 274-282. Railroad passenger and freight service, 1865-1890.

Source: U.S. Interstate Commerce Commission, Railway Statistics Before 1890, Statement No. 32151 (mimeographed), 1932.

Before 1890, the principal source of continuous information on railroads is the annual Poor's Manual of Railroads. The figures in the Manual were revised in successive issues. The Interstate Commerce Commission consulted the issues from 1869 to 1900 and evidently took account of the revisions. Earnings and traffic figures are understatements of actual level; mileage covered is shown in the table below. Similar but not identical figures, with the degree of coverage similarly indicated in terms of mileage, appear in Bureau of the Census, Report on Transportation Business in the United States at the Eleventh Census, 1890, part I.

Table I. Miles of Road Operated by Railroads

| Year | $\underset{\substack{\text { Roads } \\ \text { rearnings } \\ \text { repring }}}{\text { 1. }}$ |  | Year | $\begin{gathered} \text { Roadd } \\ \text { reporing } \\ \text { earnings } \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1880 |  |  |  | 79,009 <br> 78,909 <br> 74,150 <br> 73,508 |
| 18888-1 |  |  |  |  |
| 1887\% 18. |  |  |  |  |
| 1888 |  |  | 18751871871872187 |  |
| 1888 |  |  |  |  |
|  |  |  |  | 44,614 |
| 1880 |  |  | 185 | 8,836 |

${ }^{1}$ Includes elevated railways.
All figures are based on reports of individual railroads for fiscal years ending in the calendar year indicated. The period of time covered is, therefore, not the same for all carriers included. Balance sheet data pertain to the ends of such fiscal years.

Data for 1890 shown in these series do not agree with 1890 data shown for series Q 284-312 because of different sources.

Q 283. Freight service, ton-miles carried, 13 railroads, 1865-1885.
Source: H. V. and H. W. Poor, Manual of Railroads, New York City, 1888, p. XXVIII (reprinted with permission, Standard \& Poor Corporation).
The roads represented are 7 eastern roads (Pennsylvania; Pittsburgh, Fort Wayne, and Chicago; New York Central; Lake Shore; Michigan Central; Boston and Albany; New York, Lake Erie and Western) and 6 western roads (Illinois Central; Chicago and Alton; Chicago and Rock Island; Chicago, Burlington and Quincy; Chicago and Northwestern; Chicago, Milwaukee, and St. Paul).

Q 284-312. Railroad mileage, equipment, and passenger traffic and revenue, 1890-1970.

Source: All series, except series Q 293-294, see general note for series Q 264-412. Series Q 293, 1913-1970, and series Q 294, 1911-1956, American Railway Car Institute, New York, Railroad Car Facts, annual issues (copyright); series Q 294, 1957-1970, U.S. Interstate Commerce Commission, Transport Statistics in the United States, part 1, annual issues.

Q 285, mileage constructed. Miles on which operations were begun during the year. Figures exclude relocated road or road constructed to shorten distance without serving new territory.

Q 286, mileage abandoned. Miles on which operation was permanently abandoned during the year, the cost of which was written out of the investment accounts or was scheduled to be written out at the end of the year.

Q 289, track operated, first main track. Equivalent to miles of road operated. Figures exceed those for series Q 287, road owned, in most years because of two or more roads operating on same line under trackage agreements.

Q 300, average tractive effort. Figures represent the force in pounds exerted by locomotives, measured at the rim of the driving wheels.

Q 301-303, passenger-train cars. Includes coaches and parlor, sleeping, dining, club, lounge, observation, postal, baggage, express, and other cars, as well as cars serving a combination of purposes.

Q 311, passenger revenue. Excludes revenue from services such as handling of excess baggage or mail; sleeping and parlor or chair car reservations; dining and buffet service on trains; station, train, and boat privileges; parcel rooms; storage of baggage; or other miscellaneous services and facilities connected with the transportation of passengers. Passenger revenue depends upon the established tariffs (the published schedules of rates and fares) and includes extra fares on limited trains, additional railway fares for the exclusive use of space, mileage and scrip coupons honored, or revenue from the transportation of corpses.
Q 312, revenue per passenger mile. Represents figures for series Q 311 divided by those for series Q 307.

Q 313-314. Railroad revenue passenger-miles per car-mile and per train-mile, 1890-1970.

Source: U.S. Interstate Commerce Commission, 1890-1965, Revenue Traffic Statistics, December issues; 1966-1970, Transport Economics, June 1970, and unpublished data.

Figures for revenue passenger-miles per car-mile for 1908-1919, and for passenger-miles per train-mile for 1890-1932, were computed by the National Bureau of Economic Research from figures for pas-senger-miles, car-miles, and train-miles presented in Statistics of Railways in the United States.

## Q 315. Passenger train-miles per train-hour, 1936-1970.

Source: U.S. Interstate Commerce Commission, 1936-1957, Passenger Train Performance, December issues; 1958-1968, Annual Report, 1968 and 1969; 1969 and 1970, Transport Economics, June 1970, and unpublished data.
The train-hour figures upon which these figures are based are reckoned from the time a train leaves its original terminal to the time it arrives at its final terminal. Time spent in stopping to take on and discharge traffic and other delays on the road is included.

Q 316-318. Railroad freight revenue ton-miles per loaded car-mile, train-mile, and mile of road, 1890-1970.

Source: See general note for series Q 264-412.

## Q 319. Freight train-miles per train-hour, 1920-1970.

Source: U.S. Interstate Commerce Commission, 1920-1955, Freight Train Performance, December issues; 1956-1965, Annual Report, 1967 and 1969; 1966-1970, Transport Economics, June 1970, and unpublished data.

For explanation of train-hour figures, see text for series Q 315.

## Q 320. Freight car-miles per car-day, 1921-1970.

Source: U.S. Interstate Commerce Commission. See general note for series Q 264-412; 1956-1962, Annual Report, various issues; 1963-1965, Transport Statistics in the United States, 1967; 1966-1970, Transport Economics, June 1970, and unpublished data.

## Q 321-328. Railroad mileage and equipment, 1830-1890.

Source: See source for series Q 274-282.
Equipment data pertain to the ends of fiscal years. See also text for series Q 274-282.

## Q 329. Miles of railroad built, 1830-1925.

Source: 1830-1879, U.S. Bureau of the Census, Tenth Census Reports, vol. IV, Report on the Agencies of Transportation in the United States, p. 289. 1893-1925, Railway Age, vol. 104, No. 1, SimmonsBoardman Publishing Corp., New York, January 1, 1938, p. 66 (copyright).

For a more detailed discussion of the problems of estimating miles of railroad built, see E. R. Wicker, "Railroad Investment Before the Civil War," and the "Comment" by George R. Taylor and by Charles J. Kennedy, in Studies in Income and Wealth, vol. 24, National Bureau of Economic Research, New York.

The Tenth Census report (pp. 289-293, 300-375) contains materials on history of construction which includes figures on mileage built and existent, by groups of States, for individual companies, annually from 1830 to 1880. Somewhat similar data appear in Bureau of the Census, Report on Transportation Business in the United States at the Eleventh Census: 1890, part 1, pp. 3-5, 54-107.

According to the Bureau of the Census, information was received from every railroad known to exist in 1880. The letter of instructions from the Superintendent of the Census to the railroads said: "In cases... in which the records have been lost, the officers of such companies and roads are requested to obtain ... this information in the best form possible. The recollection of officers and employees long in the service of a road may be used... if more reliable data be not accessible."

The Railway Age obtained its figures at annual intervals from individual railroads and from State railroad commissions.

It is not clear just when a mile of road would be reported as built. Construction of some lines extended over several years. Each annual segment may have been reported when finished, or nothing may have been reported until the whole line was completed. The year of physical completion may have differed from the year in which traffic was first carried. In such cases, the mileage may have been assigned to either year.

The Census Bureau figures pertain only to miles in operation in the census year. The figures for any year are, therefore, understatements to the extent that mileage constructed in that year may have been abandoned by June 1, 1880 (the date of the 1880 Census).

The change from year to year in miles operated, series Q 321, or miles owned, series Q 322, is sometimes used as a measure of miles constructed. The annual change in miles operated, however, is also affected by acquisitions of trackage rights, as a result of which the same line may be counted in the operation of two or more railroads. The changes in miles operated and in miles owned are affected by abandonments during the year (regardless of when constructed).

Q 330. Miles of railroad operated by receivers or trustees, 1894-1970.
Source: See general note for series Q 264-412.

## Q 331-345. Railroad freight traffic and revenue, 1890-1970.

Source: See general note for series Q 264-412 except series Q 331, 332, and 338, 1964-1970, from U.S. Interstate Commerce Commission, Freight Commodity Statistics of Class I Railroads in the United States, annual issues.
Revenue-tons and ton-miles exclude the movement of a railroad company's materials and supplies on its own lines. A carload is a shipment of 10,000 pounds or more of one commodity from one shipper to one consignee.
Tons originated are tons identified as not having had previous line-haul transportation by other rail carriers; such shipments include import traffic and traffic from outlying possessions of the United States received from water carriers at the port of entry, and finished products from transit points. Ton-miles are computed by multiplying the weight of each shipment by the distance it moves and summing the products.

For definitions of ciass I, II, and III roads, see general note for series Q 264-412.

Q 333, products of agriculture. Includes not only raw farm products but simple manufactures such as flour, corn meal, cottonseed meal, cake, and linters. On the other hand, such products as vegetable oils, sugar and molasses, canned fruits and vegetables, and manufactured tobacco are included in series Q 337, manufactures and miscellaneous.

Q 335, products of mines. Includes coke as well as coal and other raw minerals.

Q 336, products of forests. Includes not only raw forest products but lumber, shingles, lath; box, crate, and cooperage materials; veneer and built-up wood.

Q 343, freight revenue. Includes revenue from the transportation of freight and from transit, stop, diversion, and reconsignment arrangements upon the basis of tariffs. Excludes revenue from such activities as switching of freight-train cars; water transfers of freight, vehicles, and livestock; movement of freight trains at a rate per trainmile or for a lump sum; storage of freight; demurrage; grain elevators; stockyards; or other miscellaneous services and facilities connected with the transportation of freight.

Q 346-355. Railroad property investment, capital, income, and expenses, 1850-1890.
Source: See source for series Q 274-282.
See also text for same series.

Q 356-363. Railroad property investment and capital, 1890-1970.
Source: See general note for series Q 264-412.
Q 356, investment, book value. Figures represent recorded value, in the accounts of carriers, of land, fixed improvements such as roadbed and track, rolling stock, maintenance machinery, etc., owned by them. Figures include property held under contract for purchase.

Q 357, depreciation reserve. Figures represent the accumulated accounting allowance for loss in service value not restored by current maintenance. The loss in value is incurred in connection with the consumption or prospective retirement of physical property in the course of service from causes against which carriers are not protected by insurance, which are known to be in current operation, and the effect of which can be forecast with a reasonable approach to accuracy.

Q 361, funded debt unmatured. Funded debt is debt maturing more than one year from date of issue.

Q 362, net capitalization. Figures represent railway capital outstanding, series Q 358, minus stocks and debt of railroad companies held by other railroad companies.

Q 364-366. Railroad capital expenditures for additions and betterments, 1921-1970.
Source: Association of American Railroads, 1921-1950, Railroad Transportation; 1951-1970, Yearbook of Railroad Facts, 1971.

Additions comprise: Additional facilities such as equipment (rolling stock), tracks, buildings and other structures; additions to such facilities, such as extensions to tracks, buildings and other structures; additional ties laid in existing tracks; and additional devices applied to facilities such as airbrakes applied to cars not previously thus equipped.

Betterments comprise improvements of existing facilities through the substitution of superior parts for inferior parts retired, such as the substitution of steel-tired wheels for cast wheels under equipment, the application of heavier rail in tracks, the strengthening of bridges by the substitution of heavier members, and the application of superior floors or roofs in buildings.

Q 367-377. Railroad income and expenses, and interest and dividends, 1890-1970.
Source: See general note for series Q 264-412.
Q 367, operating revenue. Includes revenue from freight, passenger, and other transportation and incidental services.
Q 368-370, operating expenses. Includes current depreciation.
Q 371, tax accruals. Taxes imposed by any form of government whether based on an assessed value of the property, on amounts of stocks and bonds, on earnings, income, dividends declared, payroll, number of passengers, quantity of freight, length of road, rolling stock, or other basis. Tax accruals do not include special assessments for street and other improvements, nor special benefit taxes such as water assessments.

Q 372, operating income. Figures represent net revenue from railway operations, series Q 367 minus series Q 368 , less tax accruals, series Q 371.

Q 373, net operating income. Figures represent operating income, series Q 372, minus net payable balance of equipment and joint facility rents. The equipment rents deducted at this point are those for equipment leased for less than one year, or interchanged. They are usually on a per day or per mile basis.

Q 374, net income. Figures represent net operating in come, series Q 373, plus other income, minus miscellaneous deductions and fixed and contingent charges. Fixed charges are mainly rent for leased roads and equipment (i.e., equipment leased for one year or more), and interest (except contingent interest).

Q 377, interest accrued on funded debt. Figures include interest not paid during year on debt in default of interest; they exclude interest on debt owed by the issuing company, or on debt incurred for new lines, extensions, additions or betterments, accrued before such property is completed or comes into service.

## Q 378-384. Railroad tax accruals, 1921-1970.

Source: See general note for series Q 264-412.
Other taxes, series Q 384, are largely property taxes levied by State or local governments.

## Q 385-387. Railroad highway grade crossings, 1925-1970.

Source: See general note for series Q 264-412.
Specially protected highway grade crossings, series Q 386, include crossings with operated gates, watchmen, or both, during at least part of the day, and those with audible signals, visible signals, or both; they exclude those with fixed signs only.

Q 388-397. Fuel received, ties and rails laid, and purchases by railroads, 1917-1970.
Source: Series Q 388-393, see general note for series Q 264-412. Series Q 394-397, Association of American Railroads, 1923-1964,

Railroad Transportation; 1965-1969, Yearbook of Railroad Facts, annual issues.
Q 388-390, fuel received. Figures include not only fuel for operation of trains but fuel for station, shop, or other use, except that figures for 1964-1970 include only the operation of locomotives and motorcars.
Q 391, new rails laid. Figures include both rails laid in replacement and rails laid in additional tracks, new lines, and extensions, except that figures for 1917-1926 include only rails laid in replacement.

Q 392-393, cross-ties laid. Figures for 1917-1926 include only ties laid in replacement. Of the total ties laid in 1927, 78,340,000 were in replacement. Treated ties are those which have been subjected to some preservative process, e.g., creosoting, before being placed in the track.

Q 398-399. Railroad employees and compensation, 1890-1970.
Source: See general note for series Q 264-412.
An employee is defined as a person in the service of a railroad, subject to its continuing authority to supervise and direct the manner of rendition of his service. Persons such as lawyers engaged to render only specifically defined service for specific cases and not under general or continuing retainer are not classed as employees. For 1890-1914, the number of employees represents the number on the payroll June 30 . Thereafter, the nature of the figures included for the smaller (class II and III) roads is not clear in the source. For class I roads they appear to be averages of 4 quarterly counts, 1915-1920; and of 2 quarterly and 6 monthly counts, 1921; beginning 1922, they are averages of 12 monthly counts.

Q 400-409. Railroad accidents and fatalities, 1890-1970.
Source: U.S. Federal Railroad Administration, Accident Bulletin,
annual issues (formerly issued by U.S. Interstate Commerce Commission), and related monthly reports.

Reportable railroad accidents are divided into three groups: (1) Train accidents, (2) train-service accidents, and (3) nontrain accidents. Train accidents are those arising from the operation or movement of trains, locomotives, or cars which result in a reportable death or injury and more than $\$ 750$ damage to equipment, track, or roadbed; or a collision, derailment, or other train accident, with more than $\$ 750$ damage to equipment, track, or roadbed. Train-service accidents are those arising from the operation or movement of trains, locomotives, or cars which result in a reportable death or injury but not more than $\$ 750$ damage to equipment, track, or roadbed. Nontrain accidents are those which do not result from the operation or movement of trains, locomotives, or cars.

Q 410-412. Pullman company operations, 1915-1968.
Source: U.S. Interstate Commerce Commission, Statistics of Railways in the United States and Transport Statistics in the United States, part 2, and, beginning 1963, part 1, The Pullman Company (Sleeping Car Companies), various annual issues; except series Q 411, 19151921, U.S. Office of Business Economics, Survey of Current Business, January 1939, p. 18.

Figures for series Q 411 exceed those in series Q 310, parlor and sleeping car passenger-miles, mainly because travel of railroad employees etc. (for which railroad companies receive no revenue) is not included in series Q 310; but if Pullman accommodations are paid for, the travel is included in series Q 411.

The number of Pullman employees, series Q 412, is the number on the payroll at the end of the year. The Pullman Company ceased operation in 1969.

NA Not available.
1 Excludes data for 22 companies, operating on a part-year basis.
Includes certain companies in Pennsylvania which maintained separate organizations, though controlled through stock ownership by other companies. For 1912, these companies were treated as merged and not included in the number reported.

4 Number reported as of June 30 for $1890,1922,1927$, and 1932 ; for 1902, average for
the year; for 1912, as of Sept. 16. Figures for 1937 represent an average of numbers reported on June 30 and Dec. 31.

6 Includes $29,721,000$ trolley-bus passengers.
${ }^{7}$ Includes auxiliary operating revenues of $\$ 91,242,000$ for 1922 and $\$ 8,905,000$ for 1927; auxiliary expenses, $\$ 49,232,000$ for 1922 and $\$ 7,822,000$ for 1927 . Data for operating revenues and operating expenses of auxiliary operations excluded so far as possible for earlier years.

Series Q 274-283. Railroad Passenger and Freight Service: 1865 to 1890

NA Not available.
${ }^{172.5}$ million revenue tons were carried in 1870; 55.1 million in 1861.

| * Denotes first year for which figures include Alaska and Hapraii. <br> ${ }^{1}$ This average was obtained by dividing the revenue ton-miles by the total loaded car-miles, the latter item including some cars loaded with nonrevenue freight. The method is necessary to preserve comparability with figures for the earlier years; they <br> differ slightly from the a verage "net tons per loaded car" shown in the regular monthly statements, Freight and Passenger Service Operating Statistics, based on revenue and nonrevenue ton-miles and car-miles. ${ }_{2}$ Class I and II railroads. |  |  |  |  |  |  |  |  |  |

## Chapter $\mathbf{Q}$

## Water Transportation (Series Q 413-564)

## Q 413-564. General note.

Basic governmental sources of historical merchant-marine and water-traffic statistics include American State Papers: Class IV, Commerce and Navigation, vols. 1 and 2, for 1789-1823; the various annual issues of Foreign Commerce and Navigation of the United States, for 1821-1946, originally issued by the Register of the Treasury and then by the Treasury Department, later by the Department of Commerce and Labor, and finally by the Department of Commerce; the Annual Report of the Commissioner of Navigation, 1884-1923, the issuance of which followed a similar succession beginning with the Treasury Department; annual issues of Merchant Marine Statistics, 1924-1965, originally prepared by the Department of Commerce as successor to the statistical section of the Annual Report of the Commissioner of Navigation, and issued annually by the Bureau of Customs until 1965, supplemented by records of the U.S. Coast Guard, and the various annual issues of the Annual Report of the Office of the Chief of Engineers, Corps of Engineers. The Statistical Abstract of the United States, a secondary source, also contains historical merchantmarine and water-traffic statistics. The Statistical Abstract has been issued by the following agencies: 1878-1902, Bureau of Statistics, Treasury Department; 1903-1911, Bureau of Statistics, Department of Commerce and Labor; 1912, Bureau of Foreign and Domestic Commerce, Department of Commerce and Labor; 1913-1937, Bureau of Foreign and Domestic Commerce, Department of Commerce; 1938 and thereafter, Bureau of the Census, Department of Commerce.

Congressional documents also contain historical series on the merchant marine, foreign commerce, and related fields. For 17891882, a particularly valuable collection of documents was found in the library of the Department of Commerce, bound together under the title Decadence of American Shipping and Compulsory Pilotage. The documents included are as follows: Foreign Commerce and Decadence of American Shipping, H. R. Ex. Doc. No. 111, 41st Congress, 2d session; Causes of the Reduction of American Tonnage and the Decline of Navigation Interest . . . , H. R. Report No. 28, 41st Congress, 2d session; Foreign Commerce and the Practical Workings of Maritime Reciprocity, H. R. Ex. Doc. No. 76, 41st Congress, 3d session; Causes of the Decadence of Our Merchant Marine; Means for Its Restoration and the Extension of Our Foreign Commerce, H. R. Report No. 342, 46th Congress, 3d session; American Shipping, H. R. Report No. 1827, 47th Congress, 2d session; American Merchant Marine, H. R. Report No. 363, 48th Congress, 1st session; Ship-Building and ShipOwning Interests, H. R. Report No. 750, 48th Congress, 1st session; and reports of lesser interest, H. R. Misc. Doc. No. 37 and Report No. 1848, both of the 48 th Congress, 1 st session.

Since 1921, publications of the Maritime Commission and its predecessor agencies should also be consulted, particularly the reports entitled, Ocean-Going Merchant Fleets of Principal Maritime Nations, Iron and Steel, Steam and Motor, Vessels of 2,000 Gross Tons and Over, issued quarterly or semiannually, 1921-1941, and Employment of American Flag Steam and Motor Merchant Vessels of 1,000 Gross Tons and Over, issued quarterly, 1923-1941. Finally, the Bureau of the Census (and its predecessor Census Office) published the results of five censuses of water transportation, for the years 1880,1889 , 1906, 1916, and 1926 (see general note for series Q 414-505, below).

## Q 413. Persons entering the United States by ship, 1933-1970.

Source: U.S. Department of the Treasury, Annual Report of the Secretary of the Treasury on the State of the Finances, various issues.

Data include persons entering by documented vessels, excluding ferryboats.

## Q 414-505. General note.

Statistics on documented merchant vessels and shipbuilding are from Merchant Marine Statistics, various annual issues, supplemented by records of the U.S. Coast Guard. Many are from the 1936 issue. Some of the estimates from the 1936 report have been modified, however, as explained below in table II. The text statements, and the correction of errors found in the published tables are based on reference to the primary sources, as follows: For 1789-1823, see American State Papers: Class IV, Commerce and Navigation, vols. 1 and 2 (published in 1834); for 1821-1892, see annual issues of Commerce and Navigation of the United States; for 1884-1923, see issues of Annual Report of the Commissioner of Navigation; for 1924-1945, see annual issues of Merchant Marine Statistics.

Of the Maritime Commission reports cited in the general note for series Q 413-564, above, the first, Ocean-Going Merchant Fleets..., provides data for each leading maritime nation on ocean-going merchant vessels of 2,000 gross tons and over, showing number and tonnage of such fleets classified by age, speed, size, boilers, engines, draft, etc., by major vessel type. The second, Employment of American Flag Steam and Motor Merchant Vessels . . . , shows for seagoing merchant vessels of 1,000 gross tons and over the number and tonnage of such vessels employed in U.S. foreign and domestic trade, arranged by major vessel type, ownership (government and private), and area of operation.

Census statistics on water transportation are not presented here. For reports of these censuses, see Tenth Census Reports, vol. IV, Report on Agencies of Transportation, 1880; Eleventh Census Reports, Report on Transportation Business, part 1, "Transportation by Water"; Transportation by Water, 1906; Water Transportation, 1916; and Water Transportation, 1926.

The first census, for 1880 , was limited to steam vessels. The report of this census includes a detailed history of steam navigation in the United States with separate discussion and single-year construction statistics by geographic region, from the beginning to 1880. (See T. C. Purdy, "Report on Steam Navigation in the United States," Tenth Census Reports, 1880, vol. IV.) The report of the shipbuilding census, also taken the same year, includes a detailed technical history of shipbuilding in all aspects, with particular reference to sailing craft. Single-year figures are shown for New England shipbuilding, 1674-1714, classified by type of vessel and place where built. (See Henry Hall, "Report on the Ship-Building Industry of the United States," Tenth Census Reports, 1880, vol. VIII.)

The censuses of 1889 and 1906 included all classes of vessels. However, the 1889 census included fishing vessels for the Pacific Division only and the 1906 census excluded fishing vessels. The censuses of 1916 and 1926 provided data for all U.S. vessels and craft of 5 tons net register and over, documented and undocumented, whether propelled by machinery or sails, or unrigged, except that certain specified types of vessels were excluded. (See Bureau of the Census, Water Transportation, 1926, p. 5.) While the census reports of 1850 and 1860 contain some statistics relating to water transportation, these statistics apparently were collected by other agencies.

Data shown here are for documented merchant vessels only, ex-
clusive of yachts. The following definitions are those currently applicable:

Documented vessels include all vessels granted registers, enrollments and licenses, or licenses, as "vessels of the United States," and as such have certain benefits and privileges. Vessels of 5 net tons and over owned by citizens of the United States and otherwise complying with the requirements for documentation may be documented to engage in the foreign or coasting trades or the fisheries.
Registers are ordinarily issued to vessels engaged in the foreign trade or the whale fisheries. Historically, this group has included the major portion of the whaling fleet.

Enrollments and licenses are issued to vessels of 20 net tons and over engaged in the coasting trade or fisheries.
Licenses may be issued to vessels of less than 20 net tons engaged in the coasting trade or fisheries.

Undocumented craft are those not registered, enrolled, or licensed• Barges, scows, lighters, and canal boats, without any propelling power of their own, operated exclusively in a harbor, on the canals or other internal waters of a State, or on the rivers or lakes of the United States, not in any case carrying passengers, and vessels under 5 net tons are exempt from the requirements of the laws governing documentation.

Gross tonnage refers to space measurement, 100 cubic feet equaling 1 ton; it is not a measure of weight. Gross tonnage is the capacity of the entire space within the frames and the ceiling of the hull, together with those closed-in spaces above deck available for cargo, stores, passengers, or crew, with certain minor exemptions. Before 1865, 95 cubic feet equaled 1 ton, and the admeasurement method differed in other respects.

Changes in maritime law: Admeasurement method. "Admeasurement" refers to the method of calculating gross tonnage of ships or vessels. The first law of the United States on the subject appears to have been enacted September 1, 1789 ( 1 Stat. 55). The enactment then made was reenacted with certain minor amendments in the Acts of August 4, 1790 (1 Stat. 169), and of March 2, 1799 (1 Stat. 675), and as so enacted was in force until January 1, 1865.
A basic change in admeasurement method was provided in the act of May 6, 1864, effective January 1, 1865 (13 Stat. 70-72, R. S. 4153,46 U. S. C. 77). The method described in the act of May 6 , 1864, appears to have been substantially the same as that in force in 1945.

For the transition period, 1865-1868, the total tonnage figures for the fleet are "mixed." During those years, the total fleet tonnage was obtained by combining the "old admeasurement" tonnage of vessels not yet readmeasured and the "new admeasurement" tonnage of vessels which had been readmeasured or newly built. For a recapitulation of the "old" and "new" components of the fleet tonnage (not the same vessels) for each year, 1865-1868, see Commerce and Navigation, 1870, p. 798.
No table has been located comparing the tonnage of a substantial number of vessels under 'new' and "old" admeasurement; hence, neither the magnitude nor the direction of the change can be stated bere. Apparently it varied for different types of vessels. "Brigs, schooners, and sloops measure less under the 'new' admeasurement ...while ships, barks, steamboats, and vessels having closed-in spaces above their hulls have their tonnage largely increased." Further, the difference between "old" and "new" was not believed to affect a comparison of New England shipbuilding for the years 1855 and 1868. (See Treasury Annual Report, 1868, p. 496.)
Another type of change in maritime law affecting the statistics is illustrated by the act of April 18, 1874 ( 18 Stat. 31), which exempted the greater amount of canalboat and other unrigged tonnage from documentation. (See U.S. Code, title 46, sec. 336.) For 1874-1876,
the "balance sheets of tonnage," published annually in the source volumes, record the removal of 879,000 tons of vessels for this reason alone. However, Merchant Marine Statistics, 1936, lists 843,000 tons exempted in 1876, whereas the 1876 balance sheet of tonnage specified 601,000 tons exempted. The reason for this discrepancy is not clear. The tonnage exempted annually, 1874-1936, is shown on pp. 54-55 of Merchant Marine Statistics, 1996.
At irregular intervals, steps were taken to remove from the tonnage accounts those vessels lost, abandoned, captured, sold to aliens, etc., which had not been officially reported for removal purposes. From the outsel, the failure to remove such vessels annually resulted in a cumulative error which inflated the statistics of tonnage. When general clearances of this cumulative error were made, the effect was concentrated in a single year or a small group of years.

For a basic statement on this subject, see American State Papers, cited above, vol. 1, p. 494, where Albert Gallatin, Secretary of the Treasury, outlines the problem and discusses the first attempt (1800) to deal with it. Recurrently, in the annual tonnage reports found in the source volumes, the problem is discussed, the announcement is made that the rolls have been finally cleared, and assurance is given that the problem has been solved for the future. However, as late as 1867, in spite of repeated clearances in earlier years, the "First Annual Report of the Director of the Bureau of Statistics" stated, "The tonnage returns were swelled with thousands of ghostly shipsships that had gone to the bottom years ago." (See Annual Report of the Secretary of Treasury, 1867, p. 244.)
In 1869, the Register of the Treasury attributed the entire decline of tonnage reported for 1869 to this factor. (See Treasury Report, 1869, p. 300.) In the same year, Francis A. Walker, Deputy Special Commissioner of Revenue in Charge of the Bureau of Statistics, stated that the process of assigning a number to each vessel and the institution of an annual list of vessels, as required by the Act of July 28, 1866, "has succeeded in clearing from the lists of vessels . . . a vast amount of purely fictitious tonnage, which have been carried forward from year to year although thousands of vessels which this tonnage originally represented had been meanwhile lost at sea, broken up, or sold abroad." (See Treasury Report, 1869, p. 342.)
In the "balance sheets of tonnage" published annually in the source volumes, clearances of cumulative error are generally identified as "not heretofore credited" to distinguish them from listings of removals of the various types routinely reported as having occurred during the given year.
Some of the more important clearances of this cumulative error, and the tons of shipping thereby removed, were: 1800-1901, 197,000; 1811, amount not stated but the effect is evident in series Q 418; $1818,182,000 ; 1829-1830,604,000 ; 1837,96,000 ; 1841-1842,267,000 ;$ and 1855-1858, 945,000.

In later years, the terms "obsolete," "obsolete, not heretofore reported," and "correction of balance" found in annual balance sheets of tonnage, frequently reflect removal of cumulative errors. Examples are (in tons): $1864,188,000 ; 1866,1,063,000 ; 1867,260,000$; $1868,128,000 ; 1869,338,000 ; 1870,58,000 ; 1871,103,000$; 1881, 157,000.
Other factors which require that early merchant-vessel statistics should be used with some caution are the following: (1) In some instances, systematic differences in identically described statistical series appear in the source volumes (see text for series Q 433-437) which reflect conflicting series of figures, possibly originating from different primary sources of data (see table II below); (2) transcription and typographical errors have crept into historical tables in the source volumes in the process of repeated recopying and retypesetting; (3) statistically significant footnotes which appeared in early reports frequently were dropped in later years; and (4) caution is suggested in referring back to the earlier volumes in the search for explanations of discrepancies or major changes, since the earlier data may reflect the same or similar errors.

## TRANSPORTATION

In this volume (see table II below), a number of the copying and typesetting errors have been corrected where the exact nature of the discrepancy could be determined beyond reasonable doubt; several broad differences in figures have been pointed out; and a few detailed tabular notes have been added based on information in various annual issues selected largely at random.

## Q 414-416. Employment on U.S. flag merchant vessels-basic wage scale for able-bodied seamen, 1929-1970.

Source: U.S. Maritime Administration, Seafaring Wage Rates, and unpublished data.
Seamen on both coasts receive extra pay for Saturdays and Sundays at sea. Beginning November 1955, West Coast incorporated this extra pay into base wages but East Coast did not. Monthly wage rate represents basic wage, over and above subsistence (board and room), paid to seamen having qualifying experience and employed on U.S. flag merchant vessels.
See also general note for series Q 414-505.
Q 417-432. Documented merchant vessels, by major classes, material of which built, and trade, 1789-1970.
Source: U.S. Bureau of Marine Inspection and Navigation, Merchant Marine Statistics, 1996 and 1965 (annual report now published
by the U.S. Coast Guard), and U.S. Bureau of Customs, unpublished data. (Series Q 427-428, 1884, U.S. Department of the Treasury, Annual Report of Commission of Navigation, 1884, p. 161.)
See also general notes for series Q 413-564 and Q 414-505.
For 1789-1793, tonnage figures are the "duty tonnage," i.e., the tonnage of vessels on which duties were collected during the year. (See American State Papers, cited above in general note for series Q 414-505, vol. 1, p. 895.) The "duty tonnage" appears to have been the tonnage on which duties were collected on registered vessels, including "the repeated voyages of the same vessel," plus tonnage of the enrolled and licensed vessels which paid tonnage duties once each year. (See American State Papers, vol. 1, pp. 494, 498, 528.) Beginning in 1794, "district tonnage returns" were used, derived from reports of District Collectors of Customs, which gave the tonnage of vessels in each district based on registers, enrollments, and licenses outstanding, as of December 31.
For 1794-1801, figures are district tonnage returns, with no attempt to correct for the cumulative error caused by failure to remove vessels lost, abandoned, sold to aliens, etc. (See American State Papers, vol. 1, pp. 494, 499.) The figures for $1800-1801$ ignore the first clearing of tonnage accounts which took place during these years. (See American State Papers, vol. 1, pp. 494-499, 527-531.) The correction for the cumulative error for registered vessels only would reduce the 1800 total to 819,571 tons and the 1801 total to 903,235 tons. The sharp drop attributable to the clearing of tonnage accounts would thereby be shifted back to 1800 instead of appearing in 1802.
For 1802-1818, the figures in series Q 418 consist of the "corrected registered" tonnage plus the uncorrected enrolled or licensed tonnage (see 1813 tonnage report in American State Papers, vol. 1, p. 1017). The figures for 1811 and 1818 reflect two additional attempts to clear out the cumulative error of registered vessels improperly retained on the registers. (See American State Papers, vol. 1, pp. 876, 958, and vol. 2, p. 406.)
The figures shown below in table III are those which were derived by a method authorized by Secretary of the Treasury Gallatin. They were reported to Congress in the annual tonnage reports in American State Papers as being the "actual" or "more nearly correct" tonnage.

Table III. "Actual Tonnage" of Documented Vessels: 1800 to 1818
[In thousands of gross tons]

| Year | Tons | Year | Tons |
| :---: | :---: | :---: | :---: |
| 1818 | 1,150 | 1808. | 1,173 |
| 1817 | 1,341 | 1807 | 1,208 |
| 1816. | 1,264 | 1806 | 1,166 |
| 1815 | 1,262 | 1805 | 1,085 |
| 1814. | 1,029 | 1804. |  |
| 1813 | 1,032 | 1803.... | 917 |
| 1812 | 1,127 | 1802. | 865 |
| 1811. | 1,131 | 1801-.---... | 850 |
| 1810 | 1,329 | 1800... | 768 |
| 1809 | 1,266 |  |  |

These were obtained by taking the "corrected registered tonnage" and adding to it the "duty tonnage" for enrolled and licensed vessels. Since duties were paid only once each year on enrolled and licensed vessels, and owners were not likely to pay duties on nonexistent vessels, it was reasoned that the lower "duty tonnage" figure more accurately reflected the true total for the enrolled or licensed craft than did the district returns of tonnage based on outstanding marine documents. This correction for enrolled and licensed craft was dropped after 1818, probably because, beginning 1819, the "duty tonnage" for this group exceeded the district tonnage returns for the group.

In American State Papers, vol. 1, p. 499, the tonnage described as "actual tonnage" in the comparative table for 1794-1799 is, in fact, the district returns of tonnage without correction of any kind. Elsewhere in the tonnage report for 1800 (pp. 494-499), and in tonnage
reports for later years, the term "actual tonnage" normally means the district returns based on outstanding marine documents (registers, enrollments, and licenses) corrected for cumulative error. In table III, the term "actual tonnage" is used in the latter sense; the figures are from annual tonnage reports, $1800-1818$, in American State Papers, vols. 1 and 2.
Q 427-428, vessels, by material of which built. The source publication also classifies tonnage of each material by type of propulsion (steam, motor, sail, canalboat, and barge).
Q 429-432, vessels, by trade in which engaged. The source publication also presents the number of vessels engaged in each type of trade as well as tonnage. The statutes do not recognize for documenting purposes any fisheries except the cod, mackerel, and whale. Vessels engaged in catching any other fish, such as salmon or menhaden, are documented for the mackerel fishery.
Figures in early reports identified as "registered," or as "registered in foreign trade," commonly include the registered vessels engaged in the whale fishery. Accordingly, figures on "whale fishery" found in early reports should be examined carefully to determine whether they represent the entire whaling fleet or only the "enrolled or licensed" portion. The term "fisheries" as used in early volumes refers to cod and, later, to cod and mackerel fisheries. It rarely includes the whale fishery.

In terms of documentation as "registered," "enrolled," "licensed," series Q 429-432 are composed broadly as follows:

Series Q 429 (foreign trade) represents the total "registered" minus "registered whale fishery." The "registered" whaling tonnage is, however, included for 1794-1798.

Series Q 430 (coastwise and internal) represents the portion of the enrolled or licensed group engaged in this trade. The rest of the enrolled or licensed group is in series Q 432 (cod and mackerel fisheries).

Series Q 431 (whale fishery) is the "registered whale fishery" portion of the registered fleet plus the "whale fishery" portion of the enrolled or licensed fleet. For 1794-1798, however, the registered whaling tonnage is not included here, but in series Q 429.

Series Q 432 (cod and mackerel fishery) is the cod and mackerel fishery portion of the enrolled or licensed fleet. The rest of the enrolled or licensed group is in series Q 430 (coastwise and internal).

Q 433-437. Merchant vessels built and documented, by type, 17971964.

Source: See source for series Q 417-432.
The source publication also presents statistics separately for steam, motor, and sailing vessels, canalboats, and barges. Statistics for motor vessels begin in 1893.

Beginning 1938, figures are not comparable with those for earlier years and are probably understated. They represent those vessels built during the 12 -month period which were still existent and documented as part of the merchant fleet at the end of the period. Hence, they exclude vessels completed during the period which were lost, sold to U.S. Government, sold to aliens, or otherwise removed from merchant vessel documentation before the end of the period.

Q 486a. Documented merchant vessels, western rivers (Haites), 1811-1868.
Source E. F. Haites, J. Mak, and G. M. Walton, Western River Transportation During the Era of Early Internal Improvements, 18101860, Johns Hopkins University Press, 1975, Appendix B (copyright).

This series was calculated by the authors from W. M. Lytle, Merchant Steam Vessels of the United States 1807-1868, Mystic, Conn., The Steamship Historical Society of America, 1952, and Supplements 2 (1954) and 3 (1958), edited by F. R. Holdcamper.

The Lytle List is an alphabetical Iisting of steamboats based on the original records for documented merchant vessels constructed in the United States between 1807 and 1868. The entry for each steamboat includes its gross measured tonnage (by the pre-1865 calculation), year of construction, port of construction, and year of termination of service. Steamboats operating on the western rivers during this era were of a special design. Steamboats not built on the western rivers were not well suited to operate there; steamboats built to operate there generally did not leave the river system. The western river steamboats were, therefore, isolated on the basis of their port of construction. The number and tonnage of the western river steamboats starting and terminating service each year was then calculated and these series were combined to give the tonnage in operation at the end of the calendar year.

Series Q 486a differs from series Q 486 primarily in the treatment of the steamboats that ceased operation. Figures for series Q 486a exclude steamboats in the year during which they ceased to operate. Figures for series Q 486 exclude such steamboats only at irregular intervals.

See also general notes for series Q 413-564 and Q 414-505.

Q 487-502. U.S. flag merchant vessels, steam and motor, 1934-1970.
Source: U.S. Maritime Administration, Employment Report of United States Flag Merchant Fleet Oceangoing Vessels 1,000 Gross Tons and Over, annual issues.

See general notes for series Q 413-564 and Q 414-505.
Q 503-505. Documented merchant vessels, by type of service, 19341970.

Source: See source for series Q 417-432.
Series Q 505 includes cable, cod, dredging, elevator, ferry, fireboat, fishing, ice breaker, lightering, oil exploitation, oystering, passenger, pile driving, pilot boat, police boat, patrol boat, refrigerator, towing, waterboat, whaling, welding, wrecking, and miscellaneous. The source presents details for each of these in recent years.

See also general notes for series Q 413-564 and Q 414-505.

## Q 506-517. General note.

Net tonnage capacity, as used here, refers to net or registered tonnage of the vessel, not weight of cargo. The net tonnage is what remains after deducting from the gross tonnage (defined in general note for series $Q 414-505$ ) the spaces occupied by the propelling machinery, fuel, crew quarters, master's cabin, and navigation spaces. It represents, substantially, space available for cargo and passengers. It is the usual basis for tonnage taxes and port charges. The net tonnage capacity of a ship recorded as "entered with cargo" may bear little relation to actual weight of cargo. Gross tonnage and net tonnage are both measures of cubic capacity, not of weight, 100 cubic feet equaling 1 ton. These terms should not be confused with the cargo ton of 2,000 pounds. Tonnage figures shown in series Q 507 and Q 513 for U.S. vessels entered and cleared, respectively, in foreign trade are greater than the total tonnage of U.S. vessels documented for the foreign trade because the "entered" and "cleared" series include tonnage for each vessel as often as it "enters" or "clears" each year. The documented tonnage, series Q 418, includes the tonnage of each vessel once for each year.

These figures include the tonnage of all types of watercraft engaged in the foreign trade, whether entering or clearing with cargo or in ballast, which are required to make formal entrance and clearance under U.S. customs regulations. Vessels engaged in trade on the Great Lakes with Canada as well as in trade with Mexico are also included. Vessels touching at a U.S. port in distress or for other temporary causes without discharging cargo, and Army and Navy vessels carrying no commercial cargo, are not required by customs regulations to enter or clear and thus are not included in the figures.

Vessels are reported as entered at the first port in the United States at which entry is made, regardless of whether any cargo is unladen at that port; arrivals at subsequent ports are not counted. Vessels are reported as cleared from the last port in the United States where loading of outward cargo is completed or where the vessel cleared in ballast; departures from prior ports are not counted.

## Q 506-508. Vessels entered, all ports, 1789-1970.

## Q 512-514. Vessels cleared, all ports, 1821-1970.

Source: See sources cited for specific periods for series Q 506-508. The following page numbers apply, respectively, to the sources cited for 1821-1940: 93, 287, 475, 558, and 592.

## Q 515. Total vessels cleared at seaports, $1840-1970$.

Source: Statistical Abstract of the United States. 1840 and 1850 , 1946 edition, p. $546 ; 1853-1879,1881$ edition, p. 138. 1880-1970, see source for series Q 506-508.

Q 516-517. U.S. and foreign vessels cleared at seaports, 1857-1970.
Source: 1857-1879, Statistical Abstract of the United States, 1881, p. 136; 1880-1970, see source for series Q 506-508.

Q 518-523. Value of waterborne imports and exports (including reexports) of merchandise, $1790-1970$.
Source: 1790-1820, see source for series Q 506-508; 1821-1858, U.S. Bureau of Marine Inspection and Navigation, Merchant Marine Statistics, 1936, p. 91; 1859-1935, Statistical Abstract of the United States, 1859-1866, 1895 edition, pp. 399-400; 1867-1912, 1913 edition, pp. 318-319;1913-1923,1924 edition, p. 417; 1924-1935, 1946 edition, p. 552. (See general note for series Q 413-564 for the various agencies which have issued the Statistical Abstract.) U.S. Bureau of the Census, 1943-1946, Foreign Commerce and Navigation of the United States, annual issues, 1947-1950, Waterborne Trade by United States Port, FT 972, annual issues, 1951-1970, Waterborne Foreign Trade Statistics, FT 985, annual issues (title changed to U.S. Waterborne Foreign Trade in July 1965).

The primary source of figures for $1790-1820$ is J. R. Soley, "The Maritime Industries of America," The United States of America (N. S. Shaler, Editor), vol. II, 1894, pp. 522-527, 534, 536, 538. The report gives the percent of imports and exports in U.S. vessels. Guetter and McKinley (cited above for series Q 506-508) have derived absolute figures by applying these percentages to total imports and exports of merchandise and specie. The primary source of figures for 1821-1935 is Foreign Commerce and Navigation of the United States, annual issues. Starting with 1943 , import or export statistics by method of transportation, showing shipping weight as well as dollar value, have been compiled by the Bureau of the Census.

See also general note for series U 187-352.

Q 524-529. Tonnage of waterborne imports and exports, by flag of carrier vessel, 1921-1970.
Source: U.S. Bureau of the Census, 1921-1945, Foreign Commerce and Navigation of the United States, annual issues; 1946-1957, releases and unpublished data; 1958-1970, Statistical Abstract of the United States, various issues.

Excludes cargoes (small in the aggregate) carried by ships of less than 100 tons gross capacity prior to 1946 . Beginning 1946 , excludes Army and Navy cargo, and includes Alaska, Hawaii, and Puerto Rico. Beginning July 1950, excludes commodities classified for security reasons as "special category." From July 1953 to December 1955 and July 1956 through December 1962, exports exclude shipments under $\$ 500$ in value regardless of shipping weight; for January-

June 1956, exports exclude shipments under $\$ 1,000$. For 1963 and later years, exports exclude shipments to Canada individually valued under $\$ 2,000$ and to other countries under $\$ 500$. Under $\$ 100$ shipments are excluded for all years. Beginning 1954, imports exclude shipments under 2,000 pounds shipping weight regardless of value, as well as shipments valued at less than $\$ 100$ regardless of shipping weight. For January 1960 through June 1965, imports exclude formal entry shipments valued at less than $\$ 100$ and informal entry shipments valued under $\$ 251$. For July-December 1965 and later years, imports exclude all shipments under $\$ 251$.

Q 530-541. Waterborne cargo tonnage, foreign and domestic, 19241970.

Source: U.S. Corps of Engineers, 1924-1946, Annual Report of the Chief of Engineers, part 2; 1947-1970, Waterborne Commerce of the United States, 1971, part 5, National Summaries, pp. 5 and 6.

In 1954, part 2 of the Annual Report was superseded by a separate publication entitled Waterborne Commerce of the United States (published in several regional parts). Part 5 of this report, National Summaries, presents separate figures for series Q 534-535 for "Canadian" and "overseas."

Cargo tonnage refers to the weight of cargo and should not be confused with gross tonnage shown in series Q 417-505 or the net or registered tonnage capacity shown in series Q 506-517, which are measures of cubic capacity, not of weight. See also text for those series.

Domestic commerce includes all commercial movements between points in the United States, Puerto Rico, and the U.S. Virgin Islands. Traffic with the Canal Zone is treated as foreign commerce.

Foreign commerce includes all movements between the United States and foreign countries, and between Puerto Rico and the U.S. Virgin Islands (considered a single unit) and foreign countries. Trade between U.S. outlying areas (Guam, Wake, American Samoa, etc.) and foreign countries is excluded.
"Coastwise" commerce, series Q 537, refers to domestic traffic receiving a carriage over the ocean, or the Gulf of Mexico; and to traffic between Great Lakes ports and seacoast ports, when having a carriage over the ocean.
"Lakewise" commerce, series Q 538, refers to traffic between U.S. ports on the Great Lakes System.
"Local and intraport" commerce, series Q 539, refers to movements of freight within the confines of a port whether the port has only one or several arms or channels, except car-ferry and general ferry. The term is also applied to marine products, sand, and gravel taken directly from the Great Lakes.
"Internal" commerce, series Q 540, covers traffic between ports or landings where the entire movement takes place on inland waterways; movements involving carriage on both inland waterways and waters of the Great Lakes; inland movements that cross short stretches of open waters which link inland systems; marine products, sand, and gravel taken directly from beds of the oceans, the Gulf of Mexico, and important arms thereof; and movements between offshore installations and inland waterways.
"Intraterritory" commerce, series Q 541, refers to traffic between ports in Puerto Rico and the U.S. Virgin Islands, which are considered as a single unit.

Q 542-547. Waterborne bulk freight traffic on the Great Lakes, 1900-1970.

Source: Lake Carriers' Association, Annual Report, 1970, pp. 51-52 and 76-77 (copyright).

Includes tonnage moving to or from Canadian or U.S. lake ports, in Canadian or U.S. bulk carriers.

Q 548-552. Freight traffic on the Sault Ste. Marie canals, 1855-1900.
Source: U.S. Corps of Engineers, Statistical Report of Lake Commerce Passing Through Canals at Sault Ste. Marie, 1931.

These series include traffic moving through the American and Canadian canals. Figures for later years may be obtained from various issues of Corps of Engineers, Annual Report, part 2, Commercial Statistics. They are not shown here because they pertain only to traffic between Lake Superior and the other lakes; series $\mathbf{Q}$ 542-547, therefore, provide more comprehensive totals of Great Lakes traffic.

Q 553-555. Commercial ocean traffic on the Panama Canal, 19151970.

Source: 1915-1924, Governor of the Panama Canal, Annual Report, 1948, p. 10; 1925-1970, Panama Canal Company, Annual Report, various issues (copyright).
Does not include U.S. Government traffic.
Q 556-557. Tonnage moved on New York State canals, 1837-1970.
Source: State of New York, Department of Public Works, Annual Report of the Superintendent, annual issues, and unpublished data.

Q 558. Federal expenditures for rivers and harbors, 1822-1970.
Source: 1822-1882, Statement of Appropriations and Expenditures for Public Buildings, Rivers and Harbors, Forts, Arsenals, Armories, and Other Public Works from March 4, 1789 to June 30, 1882, U.S. Senate Ex. Doc., vol. 7, No. 196, 47th Congress, 1st session (Treasury Department Doc. No. 373), pp. 521-522; 1883-1919, Federal Works Agency, records (compiled from Treasury Department accounts); 1920-1970, U.S. Corps of Engineers, Annual Report of the Chief of Engineers on Civil Works Activities, vol. I, annual issues.

Figures include expenditures for rivers, harbors, and flood control prior to 1928. In 1928, expenditures for flood control amounted to less than $\$ 13,500,000$. Figures for 1929-1970 exclude expenditures for flood control. The figures include amounts expended from emergency relief and Public Works Administration funds, 1933-1937, but exclude $\$ 5,500,000$ for purchase of Cape Cod Canal, 1928, expended by and accounted for by the Treasury Department.

Q 559-564. Investment in canals, by region and agency of enterprise, 1815-1860.
Source: H. Jerome Cranmer, "Canal Investment, 1815-1860," Studies in Income and Wealth, vol. 24, National Bureau of Economic Research, New York, 1960, pp. 555 and 556. (Copyright, Princeton University Press.)
The development of data on annual canal investment was based on an averaging process applied to the experience of a sample of 24 canals for which annual expenditure figures were available. For a list of those canals and description of the estimating operations, see source.
Adjusted estimates of annual expenditures were made for every canal or canal system undertaken between 1815 and 1860. Expenditures for river and harbor improvements were not included, nor for slack water navigation except when the expenditures were part of a canal project. The estimates were then aggregated by region and by agency of enterprise within each region. The regional estimates were then aggregated to provide estimates of annual investment in canals for the entire United States, together with estimates for State and private enterprise.

The Northeast consists of the New England and Middle Atlantic States, including Maryland and the District of Columbia. The South encompasses the area south of the Potomac and Ohio Rivers; and the West, the region north of the Ohio River, except that the Louisville and Portland canal which, though actually located in Kentucky, south of the Ohio River, is included in the West region.

Series Q 413. Persons Entering the United States by Ship: 1933 to 1970
[In thousands. For years ending June 30. Covers persons disembarking, as reported on U.S. Customs Service forms, and differs from series C 315$]$

* Denotes first year for which figures include Alaska and Hawaii.
${ }^{1}$ Includes Puerto Rico.
Series $Q$ 414-416. Employment on U.S. Flag Merchant Vessels-Basic Wage Scale for Able-Bodied Seamen : 1929 to 1970
[Except as indicated, employment data as of June 30 and wage rate data as of June 16]

Estimates of personnel employed on U.S. merchant ships, 1,000 gross tons and over Excludes vessels on inland waterways, Great Lakes, and those owned by, or operated for, the U.S. Army and Navy, and special types such as cable ships, tugs, etc.
${ }^{2}$ Decrease due to seafaring strike. Average monthy employment. ${ }^{4}$ Seamen on both coasts receive extra pay for Saturdays and Sundays at seara. Hisginning 1955, West Coast incorporated this extra pay into base wages but East CJersat did not.

## Series Q 417-432. Documented Merchant Vessels, by Major Classes, Material of Which Built, and Trade: 1789 to 1970

[Gross tonnage of documented vessels of 5 tons or more. As of December 31, 1789-1834; September 30, 1835-1842; June 30, 1843-1940; January 1 thereafter]

| Year | Number of vessels | Gross tonnage ( 1,000 ) |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

${ }^{1}$ Figures for 1924-1945 are approximations; there are some minor duplications in figures for foreign traffic. Domestic commerce, for 1924-1946, includes "rivers, canals, and connecting channels," not shown separately.

2 Includes figures for harbor traffic of New York, Philadelphia, and San Francisco; local traftic of other seaports, and local traffic of lake ports.
${ }^{3}$ Besinging 1959 , excludes traffic in Alaska and Hawaii; such traffic included in other
domestic traffic categories. domestic traffic categories.

# Air Transportation (Series Q 565-637) 

## Q 565-637. General note.

Only scattered data on air transportation are available for years before 1926. Regular collection of national statistics began with the establishment in that year of an Aeronautics Branch in the Department of Commerce. In 1934 a Bureau of Air Commerce was organized in that department. The Civil Aeronautics Act of 1938 created the Civil Aeronautics Authority, an independent regulatory agency, which was reorganized in 1940 into 2 separate entities, the Civil Aeronautics Board and the Civil Aeronautics Administration. In 1958, the latter's functions were transferred to the Federal Aviation Agency, which in turn was made a part of the Department of Transportation in 1966 and renamed the Federal Aviation Administration (FAA). The FAA's annual Statistical Handbook of Civil Aviation is the source for the statistics presented here.

Federal promotion and regulation of civil aviation are carried out by the Civil Aeronautics Board and the Federal Aviation Administration. The Board issues certificates permitting persons to engage in air transportation as a business, fixes air mail rates which they may charge, and may establish maximum and minimum rates for transportation of passengers and goods. The responsibility for investigation of aviation accidents, formerly held by the Civil Aeronautics Board, now (1975) resides with the National Transportation Safety Board of the Department of Transportation.

The principal activities of the Federal Aviation Administration are: Controlling the use of navigable airspace; prescribing regulations dealing with the competence of airmen, airworthiness of aircraft, and aircraft control; operation of air route traffic control centers, airport traffic control towers, and flight service stations; the design, construction, maintenance, and inspection of navigation, traffic control, and communications equipment for the airways; and promotion of air safety.

These agencies publish annual operational data on the use of airway facilities; data related to the location of airmen, aircraft, and airports; the activity volume in the field of non-air carrier (general aviation) flying; and aircraft production and registration.

Statistics of domestic scheduled airline operations cover trunk airlines, local service airlines, helicopter carriers, and territorial airlines except those operating in Alaska. Scheduled intrastate airlines are not included anywhere, nor are those operating locally in Alaska. Statistics of international scheduled airline operations include not only operations to and from foreign countries but overseas operations to American possessions. They also include the service of Northwest Airlines and Pan American World Airways between the United States and Alaska. Some companies operate in both the domestic and the international fields, but the statistics are segregated.

Operations of scheduled carriers of cargo only are generally not included.

## Q 565-576. Aircraft production and exports, 1913-1970.

Source: U.S. Federal Aviation Administration, FAA Statistical Handbook of Aviation, various annual issues (including, in some cases, subsequent revisions).

There is no aircraft production in Alaska or Hawaii.
Q 577-590. Scheduled air transportation, domestic and international, 1926-1970.

Source: See source for series Q 565-576.

The term certificated route air carrier refers to air carriers holding certificates of public convenience and necessity, issued by the Civil Aeronautics Board, authorizing the performance of scheduled air transportation over specified routes and a limited amount of nonscheduled operations. Certificated route air carriers are often referred to as "scheduled airlines," although they also perform nonscheduled service. Nonscheduled service comprises revenue flights that are not operated in regular scheduled service, such as charter flights, and all nonrevenue flights incident to such flights. Scheduled service is transport service operated over an air carrier's certificated routes, based on published flight schedules, including extra sections and related nonrevenue flights.

For series Q 579, the figures are for "route mileage operated" from the beginning of the series through 1961. Thereafter, they represent the total route miles for passenger/cargo and all-cargo carriers, reported separately in the source.

Series Q 589, average available seats, was derived by dividing passenger seat-miles by revenue miles flown in passenger service.

## Q 591-603. Scheduled airline revenues and expenses, 1938-1970.

Source: See source for series Q 565-576.
Q 604-623. Airports, aircraft, pilots, and miles flown, 1926-1970.
Source: See source for series Q 565-576.
Figures for airports and landing fields, series $Q$ 604-605, include civil, military, and FAA (formerly CAA) fields but exclude seaplane facilities prior to 1953. Growth of airports after 1940 was stimulated by Federal defense expenditures during World War II and by the Federal-aid airport program thereafter.

Estimates of the number of certificated pilots, series Q 607-610, refer to persons certificated by FAA in the various classifications. Some may not have been actively engaged in the classification for which they were certificated. The count of certificated pilots after 1941 is not directly comparable with the previous years as the Civil Aeronautics Regulations were amended to permit pilot certificates currently effective on April 1, 1942, to continue in effect indefinitely. This amendment expired on July 1, 1947. The number of commercial pilots, series Q 609, rose sharply after 1944 because the CAA awarded many veterans commercial certificates on the basis of their military flying experience. The number of private pilots, series $Q 610$, increased sharply after 1939 because of the federally subsidized civilian pilot training program which was initiated in 1939. It gave preliminary training to hundreds of thousands of men who went into the military service. Miles flown, series $Q 614-618$, includes business flying (by corporate executives or employees or by individuals, including farmers, on personal business), commercial flying (contract, charter, crop-dusting, photographic, etc.), instructional flying, pleasure flying, and other fiying (testing, experimental, ferrying, Civil Air Patrol, etc.). Separate data on these five categories are given in the source.

Q 624-637. Air transportation accidents, 1927-1970.
Source: 1927-1962, see source for series Q 565-576; 1963-1970, U.S. Civil Aeronautics Board, Handbook of Airline Statistics, 1971.

An aircraft accident is considered to be any occurrence, while the aircraft is operating as such, which results in fatal or serious injury
to persons or appreciable damage to the aircraft. The aircraft is considered to be "operating as such" from the time the engine is started for purposes of flight until the flight is completed; in the case of gliders, while they are under tow or gliding.

Propeller accidents to persons are included. A collision between two or more aircraft is counted as one accident.
Data include military contract operations for 1956-1970 but not for earlier years. Scheduled cargo carriers are included for 19491970, but not for earlier years.

- Represents zero. NA Not available.
sales value of "complete aircraft and parachutes, etc. For 1959-1970, represents net sales Value of "complete aircraft and parts" plus "aircraft engines and parts."
21913-1918, fiscal years; 1919-1957, calendar years. Data for the
are included with calendar year 1919.
are included with calendar year 1919.
$\frac{\text { Exclusive of gliders and barrage ballons. }}{}$ 1949-1954, civil aircraft only.
T Total value of aircraft, engines, parts, etc. Prior to 1922 , engine values were not repogines or with "parts" of aircraft. Values for parachutes and their parts have been included only since 1932 .

Series Q 577-590. Scheduled Air Transportation, Domestic and International: 1926 to 1970
[As of December 31 or for years ending December 31. All data reflect scheduled operations exclusively. Domestic data include intra-Alaska carriers beginning 1941 for series Q 586 and Q 587; 1948 for series Q 580 and Q $585 ; 1949$ for series Q 582 ; and 1961 for series Q 581]

[^164]Series Q 577-590. Scheduled Air Transportation, Domestic and International: 1926 to 1970-Con.

NA Not available.
I Figures for 1961-1970 for domestic airlines are for total aircraft in service, domestic and international.
Def ane (a) the same passengers were carried on more than 1 route of an air carrier; and (b) where the same passengers were carried by more than
${ }^{1}$ air carrier. ${ }_{3}$ Duplication has been eliminated where the same passengers were carried on more than 1 route of an air carrier, but still exists where the same passengers were carried
than 1 route of an air carrier, but stil exists where the same passenge
by more than 1 air carrier.
4 Computed by CAA from reports of duplicated revenue passengers.
${ }^{5}$ Excludes Marine Airlines.
${ }^{5}$ Excludes Colonial and Marine Airlines.
${ }^{7}$ Includes nonrevenue passenger-miles flown.
${ }_{9}^{8}$ Includes nonrevenue passengers.
${ }^{\circ}$ Exxcludes Colonial Airlines, Inc., and Hawainan Air
${ }_{11}$ Excludes Colonial Airlines, Inc.
12 Includes employees of Pan American Airways.
${ }^{13}$ Included with domestic air transportation.

## Communications

## Telephone and Telegraph Systems (Series R 1-92)

## R 1-92. General note.

Among the primary sources of governmental historical statistics relating to the telephone and telegraph industries are the following:

1. U.S. Bureau of the Census. Compendium of the Seventh Census of the United States, 1850; Compendium of the Tenth Census of the United States, 1880; Statistics of Manufactures, 1890, Census Bulletin No. 196, June 1892.
2. U.S. Bureau of the Census. Quinquennial censuses of the telephone and telegraph industry, 1902-1937: Bulletin No. 17, Special Reports: Telephones and Telegraphs, 1902; Special Reports: Telephones, 1907; Bulletin No. 102, Telegraph Systems: 1907; Telephones and Telegraphs and Municipal Electric Fire-Alarm and Police-Patrol Signaling Systems, 1912; Census of Electrical Industries: 1917, Telegraphs and Municipal Electric Fire-Alarm and Police-Patrol Signaling Systems; Census of Electrical Industries: Telephones-1917, 1922, and 1927; Census of Electrical Industries: Telegraphs-1917, 1922, and 1927; Census of Electrical Industries: Telephones and Telegraphs, 1932 and 1997. (Multiple year titles represent different volumes for each year.)
3. U.S. Interstate Commerce Commission. Reports of telephone and telegraph carriers, 1914-1933:
a. Memorandum Concerning Telephone Companies and Telegraph Companies Reporting to the Interstate Commerce Commission for the Years 1916 and 1917 (processed).
b. Annual Report on Telephone Companies, 1920-1927, 1928-1932, and 1933 (processed); Annual Report on Telegraph Companies, 1926-1927, 1928-1932, and 1933 (processed).
4. U.S. Congress. Report on Communication Companies (Splawn Report), issued as House Report No. 1273, 73d Cong., 2 d sess. (1934) in connection with the consideration of the Communications Act of 1934. This report contains detailed data from the carrier reports filed with the Interstate Commerce Commission and also the results of a questionnaire to the telephone, telegraph, and radio industries for 1922-1932.
5. U.S. Federal Communications Commission. Reports of telephone and telegraph companies filed monthly and annually with that agency, 1934-1970. Selected data from these reports have been issued either monthly or quarterly, and annually (in processed form), in the Commission's annual reports to Congress and beginning 1939, in the FCC's annual Statistics of the Communications Industry in the United States.
6. U.S. Federal Communications Commission, Investigation of the Telephone Industry in the United States, House Document No. 340, 76 th Cong., 1st sess. (1939). This report includes the results of the Commission's investigation of the American Telephone and Telegraph Company (AT\&T). Page 609 of the report refers to a number of staff reports, or exhibits, containing more detailed statistical and other material prepared in connection with the investigation and issued in processed form. These staff exhibits and reports are listed under the title, Special Investigation Docket No. 1.
7. Statistics for 1926-1934 obtained by the Federal Communications Commission from telephone and telegraph companies and designed to afford the FCC a basis for determining whether carrier rates were just and reasonable and in enforcement of other statutory responsibilities. (The text of the tele-
phone inquiry appears in "Telephone Division Order No. 9," FCC, Reports, vol. 1, p. 49; the text of the telegraph inquiry is in "Telegraph Division Order No. 12," FCC, Reports, vol. 1, p. 88. Responses are available to the public at the Commission.)

Other major sources of telephone and telegraph statistics are the annual reports to stockholders by AT\&T (Bell), the Western Union. Telegraph Company, and statisties of independent (i.e., non-Bell) telephone companies compiled and published by the United States Independent Telephone Association.
A major factor affecting the statistics of the telephone and telegraph carriers has been the prescription of uniform systems of accounts for these companies by the Interstate Commerce Commission and by the Federal Communications Commission after its formation in 1934. The ICC prescribed a uniform system of accounts for telephone companies having annual operating revenues exceeding $\$ 50,000$, effective January 1,1913 , and for telegraph carriers, effective January 1, 1914. The ICC issued more detailed accounting systems, effective January 1, 1933, for Class A companies, and condensed classifications for Class B companies, effective January 1, 1934. The FCC adopted a revised uniform system of accounts for Class A and Class B telephone companies, effective January 1, 1937. The outstanding change was a requirement that telephone plant be recorded in the accounts at original cost, i.e., cost at time of first dedication to public use. The FCC adopted a revised uniform system of accounts for Class C telephone companies, effective January 1, 1939 (the earlier ICC system had been established, effective January 1, 1915). The FCC differentiates among Class $A, B$, and $C$ companies on the basis of operating revenues, which have had varying limits over the years.

The repcrting authority of the FCC relates only to telephone and telegraph carriers engaged in interstate and foreign communication which cross State or national boundary lines over their own facilities or through connection with facilities of an affiliated carrier having such facilities. Thus, carriers filing reports with the FCC (with the exception of a small number of companies filing voluntarily) exclude a large number of small, and a few large, telephone companies.

## R 1-45. General note.

The Bell System provides the great bulk of local exchange and interexchange or toll telephone facilities and service in the United States. It includes the parent company of the Bell operating telephone companies, consolidated with "associated holding and operating companies in the United States, not including connected independent or sublicensee companies." The figures as presented are "statements of the Bell Telephone business as a whole, eliminating all duplications and showing the figures and results as 'if operated by a single company." " The parent company has been American Telephone and Telegraph Company since January 1, 1900; prior to that date it was the American Bell Telephone Company. The number of companies included within the Bell group has varied from time to time. In 1914, approximately 35 companies were included and in 1915-1916 the number increased to 39. Subsequent consolidations reduced the number to 29 in 1920 and to 25 , including Cincinnati Bell, Inc., and Southern New England Telephone Company in 1970. Since 1936, however, AT\&T in its consolidated financial statements has excluded these 2 large noncontrolled companies. For comparability with previous years, however, the figures have been adjusted to include
these 2 companies using reports filed by them with the FCC. "Bell companies" and "Bell System" are at times used interchangeably herein. Unless otherwise specified, the reference is to "Bell System." Included in the Bell organization in 1970 were the following:

1. AT\&T, which is the parent company.
2. 21 regional subsidiaries owned and controlled by AT\&T, plus a subsidiary of one of these regional companies. These 22 Bell System principal telephone subsidiaries furnish exchange and intrastate toll service, as well as interstate toll telephone service; they constitute, with the parent, the Bell System of 1970.
3. Two other major companies, Cincinnati Bell, Inc. and Southern New England Telephone Company, in which AT\&T has substantial minority interests. These 2 companies, together with the 22 above, are referred to as the Associated Companies.
4. Bell Telephone Laboratories, Inc., a scientific research and development organization, and Western Electric Company, Inc., which is the Bell manufacturing and supply organization.
In addition, a number of Bell Company affiliates have varying degrees of stock interest in various other telephone companies. Data for series R 1-30 relating to the Bell companies exclude operations of Bell Telephone Laboratories and of Western Electric, except as their operations affect operating expenses and miscellaneous income of the Bell companies. Bell Telephone Laboratories operates on a nonprofit basis and the profits of Western Electric on sales to the Bell companies are not eliminated in the consolidated statements.

The historical growth of the Western Electric Company is described in the FCC Report... on the Investigation of the Telephone Industry. . . , pp. 56-64. More recent data appear in the "Report on Preliminary Survey and Investigation of Western Electric Company, Inc.," prepared by a committee of National Association of Railroad and Utilities Commissioners and FCC representatives (July 15, 1948, processed), and in annual supplements since 1948. In 1970, AT\&T's annual share of the net income of Western Electric was over $\$ 253$ million.

Independent companies are referred to as non-Bell companies, although AT\&T or Bell companies have financial interests in some of them. The independents participate with Bell in providing toll service, and have contractual arrangements with AT\&T and the Bell Associated companies.

R 1 and R 3-8. Total telephones, Bell System teiephones, and telephones of independent companies, 1876-1970.
Source: U.S. Federal Communications Commission, unpublished data; American Telephone and Telegraph Company, unpublished data; and the following U.S. Bureau of the Census reports: Telephones and Telegraphe, 1902, table 2, ior total telephones in 1880, 1890; table 4, for total telephones in 1902; table 6, for Bell Systern telephones in 1902; Telephones, 1907, table 51, for total telephones in 1907; table 54, for Bell System telephones; Telephones and Telegraphs.... 1912, table 1, for total telephones and Bell System telephones in 1912; p. 37 for telephones connecting with the Bell System; Telephones and Telegraphs, 1932, table A for total telephones in 1917, 1922, 1927, and 1932; table 12, for Bell System telephones in 1922, 1927, and 1932; Telephones and Telegraphs, 1937, table 1, for total telephones and Bell System telephones in 1937.

The data for 1876-1934 (except census data) were taken from FCC records consisting of Special Investigation Docket No. 1, 'Report on Control of Telephone Communications," vol. III, Exhibit 2096-D, p. 11 (June 15, 1937, processed), and "Report on American Telephone and Telegraph Company Corporate and Financial History," vol. I, Exhibit 1360-A, pp. 115 and 150. The data for 1935-1956 were supplied to FCC by AT\&T; substantially the same data are also available in the AT\&T annual reports to stockholders. The data for 1957-1970 were supplied by AT\&T, compiled from annual reports and unpublished data.

The number of telephones comprises the total number of instruments and extensions in the system. Telephones also include tele-
graph and teletypewriter stations through 1930 and private line telephones through 1934, but not thereafter. Lines, basically for internal use, on which outside calls to public phones cannot be placed constitute private line telephones.

The households with telephones are based on census figures, utilized by AT\&T in conjunction with the number of telephones in residences.

## R 2. Telephones per 1,000 population, 1876-1970.

Source: 1876-1956, U.S. Federal Communications Commission, unpublished data (except for census data). For census data and 1957-1970, see source for series R 1 and R 3-8.

Annual figures are based on data supplied to FCC by AT\&T.

## R 9-12. Average daily conversations, 1880-1970.

Source: U.S. Federal Communications Commission, unpublished data. Figures are based on data supplied to FCC by AT\&T.

Generally, exchange service is telephone service within an exchange area. A local call is defined as a call originating in and completed within the same public exchange area; a toll call is one which originates in one exchange destined to another exchange area, whether located nearby or across the continent. In instances in which there is a high community of interest between exchanges, accompanied by considerable calling on a message toll basis, "extended area service" has been established under which adjacent and nearby exchanges are included in the subscriber's local service area. The growth of this type of service each year has significantly affected the number of calls classified as local, which otherwise would have been classified and charged as toll. Moreover, elimination of toll charges through the establishment of extended area service has tended to stimulate telephone usage within the service area.

Conversations are those completed calls originating from company and service telephones, excluding private line telephones. Local calls include both completed and uncompleted calls. Bell System toll messages consist of interstate and intrastate completed calls originated or terminated at Bell System Associated Company telephones, and toll messages originated or terminated at connecting (i.e., independent) company telephones, provided their transmission utilized toll line facilities of a Bell operating company. Toll messages handled wholly over facilities of connecting or nonconnecting independent companies are shown under Independent Companies. Toll message figures include ship-to-shore messages and international messages. Since a toll ticket is made for each toll call, the count can be relatively exact. In very large exchanges, some counts of local calls are automatically accumulated in message registers but in small exchanges the counts are estimates based upon samples.

R 13-16. Telephone toll rates between New York City and selected cities, 1902-1970.
Source: 1902, U.S. Bureau of the Census, Special Reports: Telephones and Telegraphs, 1902, p. 77;1911-1970, U.S. Federal Communications Commission, unpublished data.
Data for 1911-1917 are based on records of AT\&T, newspapers, and other published reports. Data for 1919-1937 are based on information in FCC, Telephone Rate and Research Department, "The Classified Toll Rate Structure and Basic Rate Practices for Message Toll Telephone Service," pp. 40-47 (Jan. 15, 1938, processed). Data for 1940-1970 are based on unpublished data and tariffs of the FCC. Considerable historical toll rate data also appear in the report of a committee of National Association of Railroad and Utilities Commissioners (NARUC) and FCC representatives, Message Toll Telephone Rates and Disparities, annual October issues.
The three major classes of toll telephone messages are dial station-to-station, operator station-to-station, and person-to-person. Dial station-to-station service denotes that service where the person originating the call from other than a coin telephone station dials
the telephone number desired and the call is completed without the assistance of a telephone company operator.

In interstate toll service, operator station rates are over 10 percent higher than dial station rates, and person-to-person rates are over twice the amount of the rates for dial station service. On station calls, the starting point is computed at the time communication is established between the calling and called stations; on person-toperson calls, the chargeable period begins when the person called is reached. There was generally no rate differentiation between station and person service until January 21, 1919.

A paucity of historical data exists with respect to local exchange rates. Such data can only be laboriously constructed from the records of the Bell System companies and other telephone companies or from the tariffs filed with each State which has regulatory authority over the intrastate telephone rates. One source of data pertaining to exchange rates is the Bureau of Census report, Telephones and Telegraphs and Municipal Electric Fire-Alarm and Police-Patrol Signaling Systems, 1912, pp.49-156, which presents telephone rates of selected cities in 38 States and the District of Columbia. Another source of exchange rate data is provided by the responses of telephone companies to FCC, "Telephone Division Order No. 9," which called for rates in effect in selected size exchanges between 1907 and 1933. These responses are on file at the FCC.

R 17-18. Telephone plant, book value and depreciation reserves, 1880-1970.

Source: 1885-1935, U.S. Federal Communications Commission, unpublished data consisting of Special Invesiigation, Docket No. I "Report on American Telephone and Telegraph Company Corporate and Financial History," vol. I, Exhibit No. 1360-A (Jan. 16, 1937, processed), pp. 73, 102; vol. II, Exhibit No. 1360-B, Schedule 2 (appendix); "Report on Associated Bell Telephone Companies Financial and Operating Data," Exhibit No. 1364 (Jan. 23, 1937), Schedule A-15; 1936-1956, American Telephone and Telegraph Company, annual reports, and FCC, unpubiished data; 1957-1970, AT\&T, annual reports and unpublished data.

Census data are from the following U.S. Bureau of the Census volumes: Compendium of the Tenth Census, 1880, p. 1332; Telephones and Telegraphs, 1902, table 6, p. 7; Telephones and Telegraphs..., 1912, table 29; Telephones, 1917, table 33; Telephones, 1922, table 34; Telephones and Telegraphs, 1932, table 17, and 1937, table 1 (see general note for series R 1-92 for complete list of census sources).
The FCC's uniform system of accounts, which became effective January 1, 1937, requires establishment of telephone plant accounts on the basis of original cost (cost at time of first dedication to the public use). This applies to all plants ordinarily having a service life of more than one year as well as franchises, patents, rights of way, leaseholds, and other interests in land.
The depreciation policies of the Bell System have undergone various changes from a simple maintenance reserve set up for the purpose of equalizing maintenance charges over a period of years and providing for deferred maintenance expenses, to depreciation rates prescribed by the FCC. Prescription of depreciation rates for Bell companies began in 1949 and initial prescriptions were completed in 1953. For a discussion of Bell System depreciation policies, see Report of the Federal Communications Commission on the Investigation of the Telephone Industry in the United States, pp. 325-349.

## R 19. Miles of wire, 1880-1970.

Source: 1880-1884, American Telephone and Telegraph Company, unpublished financial report; 1885-1935, U.S. Federal Communications Commission, unpublished data consisting of Special Investigation Docket No. 1, Exhibit No. 1360-A, pp. 76, 115; 1936-1956, AT\&T, annual reports, and FCC, unpublished data; 1957-1970, see source for series R 17-18.

Census data are from the following U.S. Bureau of the Census volumes: Compendium of the Tenth Census, 1880, p. 1327; Telephones
and Telegraphs, 1902, table 2; Telephones, 1922, table 21; Telephones and Telegraphs, 1937, table 14.

Miles of wire are not an adequate index of the growth in telephone capacity for a variety of reasons: The shift from single open wire lines to complex cable systems including coaxial tubes; use of carrier systems to increase significantly the number of communication channels over a band of frequencies transmitted over an electrical circuit; and use of microwave radio systems not included in the statistics of wire lines.

R 20-22 and $\mathbf{R}$ 27-28. Operating revenues, net income, and dividends, 1880-1970.

Source: 1881-1914, U.S. Federal Communications Commission, unpublished data consisting of Special Investigation Docket No. 1, Exhibit No. 1360-A, pp. 39, 54, 73, 81, 89, 109 (for operating revenues and division between local and toll revenues, 1900-1914, Schedule B-2 of Special Investigation Docket No. 1, Exhibit No. 1364 combined with Long Lines revenues from p. 395 of Exhibit 1360-B); 1915-1956, American Telephone and Telegraph Company, annual reports, and FCC, unpublished data; 1957-1970, see source for series R 17-18.

Census data are from the following U.S. Bureau of the Census reports (see general note for series R 1-92 for detailed listing of sources): Compendium of the Tenth Census, 1880, p. 1329; Statistics of Manufactures, 1890, pp. 1, 5; Telephones, 1907, table 36; Telephones and Telegraphs..., 1912, table 29; Telephones, 1917, tables 21, 30, and 31; Telephones, 1922, tables 2, 31, 32; Telephones, 1927, table 1; Telephones and Telegraphs, 1932, table 1, and 1937, table 1.

Figures for series R 20-22 for 1900-1914 have been adjusted by the FCC by subtracting uncollectible operating revenues so that they are comparable with figures for 1915-1970.

Operating revenues include monthly service charges; amounts charged for connection, restoration and termination of service, and for moves, instrument changes, and similar service requirements; initial nonrecurring charges for plant or equipment, except initial charges based on the cost of specially assembled private branch exchanges; and amounts of service charges for supplemental or auxiliary equipment as extension stations and auxiliary receivers. Operating revenues include the telegraph services of the Bell System, including revenues derived from teletypewriter exchange service (TWX), and private line service; international radiotelephone service; directory advertising and sales; and rent revenues.
Net income is net operating income and other income, including dividend income and interest income, including interest charged to construction; minus miscellaneous deductions from income and fixed charges (as interest deductions). All of the Bell System operations are included; however, as noted below (see text for series R 25), prior to 1933 only the dividends from controlled companies not consolidated were included.
Dividends declared refer to the entire Bell System operations, excluding dividends paid by one system company to another.

## R 23. Operating expenses, 1880-1970.

Source: 1885-1907, U.S. Federal Communications Commission, unpublished data consisting of Special Investigation Docket No. 1, Exhibit 1360-A, pp. 54, 73, 109 (figures for operating expenses derived by subtracting net earnings from revenues); 1908-1935, American Telephone and Telegraph Company, annual reports; 1936-1956, AT\&T, annual reports, and FCC, unpublished data; 1957-1970, see source for series R 17-18. For census data, see source for series R 20-22 and R 27-28.

For 1885-1907, FCC's figures include all taxes (including Federal income taxes) and interest expense and miscellaneous income. For 1908-1913, figures also include Federal income taxes. For 19141920, figures were adjusted to exclude estimated amounts of Federal income taxes by use of annual reports of the individual Bell Telephone
companies to the Interstate Commerce Commission. For 1921-1935, the Federal income tax adjustment was obtained from AT\&T unpublished data.

Figures include that portion of the expenses of Bell Telephone Laboratories absorbed by AT\&T.

## R 24. Federal income taxes, 1914-1970.

Source: 1914-1920, U.S. Federal Communications Commission, unpublished data (approximations derived from annual reports of individual Bell System companies to the ICC); 1921-1935, American Telephone and Telegraph Company, unpublished data; 1936-1956, AT\&T, annual reports, and FCC, unpublished data; 1957-1970, see source for series R 17-18.

## R 25. Other income, net, 1882-1970.

Source: 1882-1956, American Telephone and Telegraph Company, annual reports, and U.S. Federal Communications Commission, unpublished data; 1957-1970, see source for series R 17-18.
Since 1933, instead of including under this item only the dividends from controlled companies not consolidated, the AT\&T has included its proportionate interest in the total earnings or deficits of such companies.

## R 26. Interest expenses, 1885-1970.

Source: 1885-1956, American Telephone and Telegraph Company, annual reports, and U.S. Federal Communications Commission, unpublished data; 1957-1970, see source for series R 17-18. Census data are from the following U.S. Bureau of the Census reports: Special Reports, Telephones, 1907, table 57; Census of Electrical Industries: 1917, Telephones, table 30; Census of Electrical Industries: Telephones, 1922, table 31.

Interest expense includes interest on all classes of debt owing to the public but excludes intercompany interest payment.

## R 29-30. Employees and wages, 1880-1970.

Source: Series R 29, 1885-1899 and 1907-1935, U.S. Federal Communications Commission, unpublished data consisting of Special Investigation Docket No. 1, Exhibit No. 1360-A, pp. 76, 136, 147; series R 29-30, 1900-1906, and series R 30, 1918-1935, American Telephone and Telegraph Company, unpublished data; series $\mathbf{R}$ 29-30, 1936-1956, AT\&T, annual reports to stockholders, and FCC, unpublished data; 1957-1970, see source for series R 17-18.

Census data are from the following U.S. Bureau of the Census reports (see general note for series R 1-92 for detailed description of sources): Compendium of the Tenth Census, 1880, p. 1327; Statistics of Manufactures, 1890, p. 1; Telephones and Telegraphs, 1902, tables 2, 6; Telephones and Telegraphs..., 1912, tables 3, 29; Telephones, 1917, table 1; Telephones, 1922, table 1; Telephones 1927, table 1; Telephones and Telegraphs, 1932, table 1; Telephones and Telegraphs, 1937, table 1.

Employee figures for 1885-1935 exclude Western Electric Company.
Figures for 1939-1956 also appear in the FCC annual issues of Statistics of the Communications Industry in the United States. These issues also contain detailed reports of the occupational classifications and wage rates of Bell System employees.

R 31-45. Independent telephone companies-property, revenues, expenses, interest, net income, dividends, employees, and wages, 1916-1970.

Source: U.S. Federal Communications Commission, 1916-1934, unpublished data. United States Independent Telephone Association (USITA), 1935-1962, Annual Statistical Volume of the United States Independent Telephone Association, various issues (copyright); 19631970, Independent Telephone Statistics, annual issues (copyright).

Census data are from the following U.S. Bureau of the Census reports (see general note for series R 1-92 for detailed description of sources): Telephones, 1917, tables 1, 30, 31, 33; Telephones, 1922, tables 1, 22, 32; Census of Electrical Industries: Telephones, 1927, tables 1, 34; Telephones and Telegraphs, 1932, table 1, and 1937, table 1.

The large discrepancy between the census figures and the Federal Communications Commission and USITA figures is due to the major differences in coverage. The following excerpt from Bureau of the Census, Telephones, 1922, refers to census coverage:

Unit of enumeration ("system" or "line").-So far as practicable, a report was secured for each system or line operated under separate ownership. The terms "system" and "line" are sometimes used synonymously but, in general, the former is employed with reference to the aggregations of lines operated by the larger companies while the latter is more commonly used to denote the small farmer or rural lines. A farmer or rural line may be merely an individual line connected with an exchange under different ownership, or may be a party line without an exchange or connected with an exchange owned jointly with other lines or under independent ownership.

Figures for 1916-1933 were based on ICC annual summaries (which did not differentiate between the Bell System and the independent telephone companies) and were derived by subtraction from the ICC figures of those amounts for each company included on a consolidated basis in the data shown for series R 17-30.
Figures for 1935-1970 were obtained by USITA from reports of independent telephone companies to the USITA. For recent years, the publications provide detailed data on companies reporting to the USITA, and limited data in respect to companies not reporting to the USITA. Certain totals for combined reporting and nonreporting independent companies are shown for 1961-1970 in the USITA 1971 Annual Statistical Volume.

A discussion of the relations between the Bell System and the Independents is presented in the FCC Report . . . on the Investigation of the Telephone Industry . . . , pp. 123-146; and a Report of Committee of National Association of Railroad and Utilities Commissioners and FCC representatives, Message Toll Telephone Rates and Disparities.

## R 46-74. General note.

Since the 1850 's, the Western Union Telegraph Company has been the dominant carrier in the domestic telegraph industry. Established in 1851 as the New York \& Mississippi Valley Printing Telegraph Company, this company succeeded by 1866 in acquiring or merging dozens of competing telegraph companies and emerging as the sole telegraph company in the United States. (See Robert Luther Thompson, Wiring a Continent; the History of the Telegraph Industry in the United States, 1832-1866, Princeton University Press, 1947.) In succeeding decades, smaller telegraph companies were formed, serving a region or major cities, often with the intent of forcing Western Union to acquire them. Western Union developed close contractual ties with the railways. Telegraph pole lines were constructed along railroad rights-of-way. The lines were used jointly for general telegraph and railroad telegraph communication and signaling; and railroad stations and personnel were used for the pick-up and delivery of telegraph messages.

Western Union's most serious telegraph rival, Postal Telegraph, was acquired by the Mackay interests in the 1880 's as the domestic pick-up and delivery agent for Mackay's Commercial Cable Company (later the International Telephone and Telegraph Company). Until the 1920's, Postal Telegraph competed with Western Union for the larger and more profitable routes. Beginning in the 1920's, Postal Telegraph attempted to provide a nationwide service in full competition with Western Union. Postal Telegraph expanded its own facilities and also made arrangements with the telephone com-
panies, gasoline stations, and others for the pick-up and delivery of telegrams.
The expansion of Postal Telegraph coincided roughly with the emergence of more effective competition from other sources. Predominantly, such competition came from the growth and development of toll telephone service, the expansion of domestic airmail, the introduction of the Bell System's teletypewriter exchange service (TWX), which was sold to Western Union in 1971, and the provision of domestic radiotelegraph service by the international radiotelegraph carriers, RCA Global Communications and the Mackay Companies. (In 1942, as a war measure, domestic radiotelegraph service was discontinued and was not subsequently resumed.) Postal Telegraph's share of domestic telegraph revenues was less than 25 percent. In 1943, Postal Telegraph merged with Western Union. (See U.S. Federal Communications Commission, Reports, vol. 10, pp. 148-198, September 27, 1943, for Commission approval of the specific terms of the merger.)

R 46-55. Western Union Telegraph Company-summary of facilities, traffic, and finances, 1866-1915.

Source: Series R 46-49 (except 1913), The Western Union Telegraph Company, annual reports; 1913, Moody's Investors Service, Moody's Public Utilities Reports, 1919, New York (copyright). Series R 50-55 (except R 52, 1914-1915), U.S. Interstate Commerce Commission, Bureau of Valuation, Accounting Reports, The Western Union Telegraph Company (December 31, 1915 and June 30, 1919); series $\mathbf{R}$ 52, 1914 and 1915, U.S. Federal Communications Commission, unpublished data. Census data are from the following U.S. Bureau of the Census reports: 1880, Compendium of the Tenth Census, 1880, pp. 1310-1325; Special Reports: Telephones and Telegraphs, 1902, tables 39, 41; Telegraph Systems: 1907, tables 1-8; Telephones and Telegraphs..., 1912, tables 2, 3.
The data for series R 52, 1914 and 1915, are based on ICC Bureau of Valuation report cited above, Exhibit V, sheets 2 and 3.
According to the Compendium of the Seventh Census, 1854, p. 189, there were 89 telegraph lines having 23,261 miles of wire in 1853. In 1854, the miles of wire were estimated at over 30,000 .
The 1880 census data include many companies in addition to Western Union, and the later census data include Postal Telegraph as well as reports from some 15 to 20 small companies. Included in the Postal Telegraph data were the telephone operations of that company. The 1902 census data include the several domestic ocean-cable systems, while the 1880, 1907, and 1912 census figures exclude ocean-cable systems other than the Western Union Cable Division.
Other statistics appear in 60th Cong., 2d sess., Investigation of Western Union and Postal Telegraph-Cable Companies, U.S. Senate Document No. 725 (1909); State of New York, Proceedings of Joint Committee Investigation of Telephone and Telegraph Companies (1910); and Submarine and Land Telegraph Systems of the World, an excerpt from the Treasury Department, Monthly Summary of Commerce and Finance, January 1899.

R 56-70. Domestic telegraph industry-messages, property, revenues, expenses, netincome, dividends, employees, and wages, 1916-1970.
Source: 1916-1928, U.S. Interstate Commerce Commission and U.S. Federal Communications Commission, unpublished data (annual reports of Western Union Telegraph Company and Postal TelegraphCable Company to the IC.C); 1929-1955, FCC, Statistics of the Communications Industry in the United States, 1955, pp. 110-115; 19561970, FCC, Statistics of Communications Common Carriers, annual issues, and unpublished data (data are from the annual reports of Western Union Telegraph Company to the FCC). Census data are from the following U.S. Bureau of the Census reports (see general note for series R 1-92 for detailed identification of sources): Census of Electrical Industries: 1917, Telegraphs . . ., tables 1, 2, 4, 5; Tele-
graphs, 1922, tables 2, 3, 5, 6; Telegraphs, 1927, tables 2, 3, 5, 6; Telegraphs, 1932, tables 2, 3, 4; Telephones and Telegraphs, 1937, tables 2, 3, 4.

For 1916-1928, the Western Union reported landline (domestic) and cable operations on a merged basis; therefore, supplementary material was obtained from Western Union relating to the landline operations. Necessarily, these involve estimates and allocations, the precise bases of which were not specified. For 1929-1955, figures were obtained from annual reports of the telegraph carriers to the ICC and to the FCC, supplemented by correspondence and reference to the reports of the telegraph companies.
Each census report, 1917-1937, included Western Union Cable Division with Western Union telegraph plant. Similarly, the census reports of 1917, 1922, and 1927, in reporting Western Union operating revenues, operating expenses, net income, and dividends declared, include Western Union cables. Apparently, in each census report, number of employees and wages and salaries were for Western Union landline system only.
The census data refer to approximately 15 to 20 minor domestic telegraph companies, in addition to Western Union and Postal Telegraph. In 1943, Western Union acquired Postal Telegraph, and the telegraph company data, beginning in 1944, relate to the single merged carrier.

R 56, messages handled. Prior to 1935, the annual count of revenue messages handled was based on a count of messages during the month of January and was partly estimated. For 1935-1950, most of the Western Union message data were based on an actual count for 2 days in each month at some 400 of the largest offices which together accounted for about 80 percent of total message revenues. The Postal Telegraph data continued to be based on counts and estimates for the month of January projected to annual totals. For 1950-1970, Western Union used a scientifically constructed random message sample, the results of which provide generally reliable monthly and annual message data by service classes and rate zones.

Data include telegraph traffic with Canada and Mexico. Such traffic forms only a small portion of the message data.

R 57, private-line telegraph service revenues of telegraph companies. For 1916-1935, data were furnished to FCC by Western Union and added to annual report figures for Postal Telegraph; for 1936-1943, figures are from annual reports of Western Union and Postal Telegraph.

Private line, or leased circuit, revenues are derived from the lease of wires, cables, channels, circuits, and similar wire-telegraph facilities to banks, airlines, governmental agencies, and other large organizations for the exclusive use of these customers. The charge for such service is based on contractual rent agreements providing for definite periodic terms without regard to the extent of the service obtained by the users of such facilities.

R 58, private-line telegraph service revenues of telephone companies. Data for 1916-1938 apply to the Bell System telephone companies only. Data for 1916-1926 and 1935-1938 were obtained from unpublished data of the Bell System. Data for 1927-1934 were obtained from the Bell System response to the FCC, "Telegraph Division Order No. 12," and appear in "Some Aspects of Competition Affecting the Land Wire Telegraph Industry" (1937), an unpublished FCC staff study. For 1939-1970, data include all telephone companies reporting on an annual basis to the FCC (roughly varying between 60 and 125).

R 59-60, telegraph plant. Effective January 1, 1914, the ICC prescribed a Uniform System of Accounts for telegraph and cable companies and required the carriers to keep their accounts in conformity with this system. All charges made to plant and equipment or other property accounts with respect to any property acquired on or after January 1, 1914, were to be the actual money costs of the property. The ICC did not attempt to prescribe the depreciation rates of the carriers.

In 1940, the FCC adopted a revised uniform system of accounts for wire telegraph and ocean cable carriers, to go into effect January 1, 1942. The effective date was later postponed to January 1, 1943. The new system was designed to supplant the previous system in use since 1914. The FCC prescribed depreciation rates for the telegraph carrier, effective January 1, 1948. After the merger of Western Union and Postal Telegraph, the Commission required that the merged carrier reclassify its plant as of January $1,1943$.

Telegraph plant book costs for 1946-1970 were affected by two conflicting factors: Accelerated retirement of old plant, and addition of new plant as part of the general modernization program of the Western Union Telegraph Company begun in 1946. As part of its modernization program the Western Union Telegraph Company leased substantial plant, in the form of voice channels, from the Bell System.

Census figures on book cost of plant include Western Union cables in all years.
$\mathbf{R}$ 61, miles of wire. Wire figures are not a satisfactory measure of the capacity of the domestic telegraph industry for various reasons, including the shift from less efficient open wire to more efficient cable; the introduction of multiplex terminal equipment, which has permitted a significant subdivision of each telegraph channel and the simultaneous transmission of messages on each such subdivision; the leasing from the Bell System telephone companies of voice-frequency channels and the subdivision of these channels into a substantially greater number of telegraph channels; operation by Western Union of its microwave radio system for the transmission of messages; and use of modernized routing and switching systems.
$\mathbf{R}$ 62-68, finances, employees, and wages and salaries. Operating revenues are derived, in the bulk, from various transmission and nontransmission telegraph services. However, a small proportion has been derived from incidental services, such as errand service, time service, and code registration. The operations of the former Postal Telegraph toll telephone system were included until February 1, 1952, when Western Union disposed of this service. Also included in operating revenues are revenues derived by the domestic telegraph carrers in handling the domestic haul of insular, mobile, and foreign cable and radiotelegraph communications. Such domestic haul is between the "gateway" cities and the interior of the nation.

To obtain data on total operating expenses, the domestic telegraph carriers (Western Union and Postal Telegraph) were required to subdivide their expense accounts as between domestic and international operations in respect to compensation, overhead, materials and supplies, and other charges. Such allocations are subject to some arbitrariness.

Census data for 1917, 1922, and 1927 with respect to operating revenues, expenses, and net income differ from the other data as a result of the inclusion of Western Union cable operations and the inclusion of minor companies, in addition to Western Union and Postal Telegraph.

No adjustments were made in the annual reported income statements. Thus, the net loss shown for 1945 resulted from a substantial retroactive wage award made by the War Labor Board. This was shown in the 1945 statement of the Western Union Telegraph Company as an extraordinary charge (less recoverable income taxes).

Income taxes (through 1963, when the cables were sold) are total Western Union income taxes minus those assigned by the company itself to its cable operations. The amounts assigned to Western Union cables were obtained by the FCC from Western Union on an informal basis. Income taxes for 1924 and prior years are not available separately and are included in total operating expenses.

Dividends declared (through 1963, when the international operations were sold), include the entire operations of Western Union, domestic and international. No basis exists for allocating them.
Number of employees was reported as of different periods: 19291934, at the end of June; 1935-1945, at the end of December; and 1946-1970, at the end of October. However, wages and salaries are uniformly reported for the calendar year ending December 31.

R 69-70, Bell Teletypewriter Exchange (TWX) Service. For 1931-1934, data are from responses to FCC, "Telegraph Division Order No. 12'; for 1935-1938, from the FCC Annual Report.

Teletypewriter exchange service (TWX) was initiated November 21,1931 . The revenues from this service, as well as the private line telegraph revenues of telephone companies, are not included in total operating revenues, which is limited to the revenues of domestic telegraph carriers. The TWX service of the telephone industry was purchased by Western Union in 1971.

## R 71-74. Domestic telegraph message rates and TWX rates between

 New York City and selected cities, 1850-1970.Source: U.S. Federal Communications Commission, unpublished data.

The 1850 rates are cited in William Holmes, History of Telegraph Rates, 1860 to 1913 (an unpublished study obtained by the FCC from the Western Union Telegraph Company), p. 2. The same source states, p. 8, that the New York-Chicago rate from 1866 to October 1, 1869 , was $\$ 1.85$, although James D. Reid, The Telegraph in America (1886), p. 746, states that the Chicago rate was $\$ 2.05$ between 1866 and 1869, and U.S. Senate, 60th Cong., 2d sess., Investigation of Western Union and Postal Telegraph Cable Companies, Document No. 725 (1909), p. 24, claims that in 1866 this rate was $\$ 2.20$. Holmes, p. 8 , is the source for the 1866 and 1869 New York-Philadelphia rates. Reid, p. 746, quotes the New York-San Francisco rates for 1866 and 1869. The Investigation of Western Union..., p. 24, is also the source for the New York-Denver rate as of 1866 . The 1870 rates are mentioned in 51st Cong., 1st sess., Hearings before the House Committee on the Post-Office and Post-Roads on Postal Telegraph Facilities, p. 131. In addition, Holmes, p. 9, states that in 1870 the maximum rate from States north of Washington, D.C., to San Francisco was reduced from $\$ 7.45$ in currency (or $\$ 6.75$ if paid in gold) to $\$ 5.00$ in currency (or $\$ 4.00$ in gold). The 1873 rates are shown in Investigation of Western Union..., p. 24. Holmes, p. 10, states that the $\$ 2.50$ San Francisco rate became effective February 1, 1873, and a reason given was that $\$ 2.50$ was the denomination of a coin in common use on the Pacific Coast. The same source, p. 12, describes the New York-Chicago rate in 1875 as having been 25 cents and in 1877 as being successively increased to 40 cents, 50 cents, and 60 cents. Holmes also states, p. 11, that the New York-Denver rate became $\$ 2.00$ in March 1876 and that the San Francisco rate was reduced to $\$ 2.00$ in August 1876. However, Reid mentions, p. 747, March 1877 as the date $\$ 2.00$ was fixed as the maximum rate between New York City and points east of the Rocky Mountains. The 1883 rates are also from Investigation of Western Union..., p. 24. Holmes, p. 17, states that the $\$ 1.00$ San Francisco rate became effective in March 1884 as part of a general reduction which established $\$ 1.00$ as the maximum rate for a 10 -word full rate telegram between any two points in the Western Union system. Holmes also reports, p. 17, that in June 1884 the rate between New York and Chicago charged by Western Union was 50 cents, by Postal Telegraph, 25 cents, and by the Baltimore and Ohio Telegraph Company, 40 cents. The 1888 rates are based on State of New York, Report of the Joint Committee of the Senate and Assembly of the State of New York Appointed to Investigate Telephone and Telegraph Companies (transmitted to the Legislature March 21, 1910), p. 687, and the annual report of Western Union to stockholders for 1888 , p. 5. The 1890 rates are from Hearings Before the House Committee on the Post-Office and Post-Roads on Postal Telegraph Facilities, p. 68. The rates in effect as of 1908 are from Investigation of Western Union . . . , p. 24, although there is evidence from other sources that some of these rates were put into effect in 1907. The 1919 rates were the result of a 20 percent increase in domestic telegraph rates as set forth in the 1919 Western Union annual report to stockholders, p. 8.

The 1931 TWX rates are from testimony on behalf of AT\&T by Mr. Carroll O. Bickelhaupt in the hearings pursuant to FCC, 'Telegraph Division Order No. 12."

All rates beginning with the 1946 increase are derived from official tariffs filed with the FCC.
The census report, Special Reports: Telephones and Telegraphs, 1902, states (p. 14) that the first telegraph rate was applicable in 1845 between Baltimore and Washington and was one cent for each group of four characters. The rates shown here are mainly those of the Western Union Telegraph Company. During some of the early years, lower rates were sometimes published by competing companies. The frequent changes in the New York-Chicago rate illustrate particularly the effects of competition. New companies appeared offering lower rates on this basic route and Western Union was forced to meet the competition until such time as it succeeded in acquiring the competing company. Moreover, it is not certain that the published rates were adhered to uniformly, particularly in the early years of telegraph development and in periods of depression. Under the stress of competition, rebates were sometimes allowed.

The rate for the full-rate telegram is the keystone of the telegraph rate structure. Rates for most other public message telegraph services (day letters, night letters, etc.) are a percentage of the rates for the full-time telegram. Between 1908 and 1946, there was no change in the level of the full-rate telegram, except for the increase effected in 1919. However, while maintaining the rate level on its full-rate telegrams, Western Union introduced various new classifications (including the fixed text social message and serials) which in effect provided discounts to the message customer.

TWX is provided only by the Bell Telephone System but this service was sold to Western Union in 1971. As contrasted with message telegraph service, which is a 1 -way communication service, TWX provides 2-way, instantaneous communication service between TWX subscribers. The maximum number of words which can be transmitted in the 3 -minute rate period depends on the speed of the transmitting operator (provided by the subscriber) and the maximum rated speed of the TWX equipment. In addition to the charges for specific use (measured in time units and distance) of the facilities, TWX subscribers beginning July 1, 1953, were billed a monthly service charge of $\$ 10$. This was increased to $\$ 40$ on September 1,1966 , and to $\$ 45$ on February 1,1970 , for 60 -speed service.

## R 75-88. General note.

The first successful cable linking North America with Europe was laid in 1866. Radio was not a significant factor in overseas telegraphy until 1920 when the newly formed Radio Corporation of America (RCA) entered the field as successor to Marconi Company of America. The record of hearings held in 1929 before the Committee on Interstate Commerce, United States Senate, 71st Cong., 1st sess., on S. 6, a "Bill to Provide for the Regulation of the Transmission of Intelligence by Wire or Wireless," contains (pp. 960-972) a list of submarine cables of the world, and the year in which each was laid. Few of these cables are now in use, having been replaced by circuits in telephone ocean cables laid since the mid-1950's and, since 1965, also by circuits in microwave radio relayed by satellite. Information on the beginnings of international radiotelegraphy appears in the Report of the Federal Trade Commission on the Radio Industry (1924).
The first overseas radio telephone service was opened in 1927 between New York and London by American Telephone and Telegraph Company. The only overseas telephone service available during 1921-1926 was to and from Cuba by means of cable.

The census data are derived from the special quinquennial census reports of the telephone and telegraph industries (see general note for series R 1-92). With respect to international telegraph, these reports suffer from two major shortcomings. First, the Bureau of the Census was unable to obtain from the Western Union Telegraph Company a division between its landline system and its cable operations with respect to plant and financial operations. Prior to the 1932 census, Western Union provided separate data for its cable operations only in the categories of messages and cable mileage.

In the censuses of 1932 and 1937, Western Union also supplied operating revenue information for its cable system. The absence of Western Union's Cable Division from the census data on the ocean-cable companies largely accounts for the significant differences between the census data and the annual series with respect to telegraph plant book cost and depreciation reserves, operating revenues, operating expenses, and net income.
A second shortcoming of the census data is the lack of adequate coverage of the radiotelegraph industry. The financial information included in the 1922 and 1937 census compilations is seriously distorted because of the failure to exclude various activities of the Radio Corporation of America not related to its telegraph communications business. In the 1932 census, no information on radiotelegraph appeared, while in the 1937 census the published statistics relate only to messages and operating revenue. Consequently, the only census data shown with respect to radiotelegraph are the message statistics, and $\$ 9,515,000$ in operating revenues included within the 1937 cable-radiotelegraph total.

R 75-77, R 79-81, R 83-88. Telegraph messages, plant, nautical miles of ocean-telegraph cable, operating revenues and expenses, Federal income taxes, net income, employees, and wages, 19071970.

Source: U.S. Federal Communications Commission, 1916-1928, unpublished data; 1929-1956, Statistics of the Communications Industry in the United States, 1955 and 1956 issues, table 19; 19571970, Statistics of Communications, Common Carriers, annual issues. Census data beginning 1907 are from the following U.S. Bureau of the Census reports (see general note for series R 1-92 for detailed description of sources): Telegraph Systems: 1907, pp. 10, 19; Telephones and Telegraphs..., 1912, pp. 165, 167; Telegraphs, 1927, pp. 19, 25; Telephones and Telegraphs, 1937, pp. 49, 52.

Annual data prior to 1929 were derived in part from annual reports of the carriers filed with the Interstate Commerce Commission. In large part, these data were obtained through field examinations by the staff of the FCC and from data supplied by the carriers upon specific request.
Figures include Hawaii and Puerto Rico for all years. There is no international telegraph industry in Alaska; however, international telegrams originating or terminating there are included in series R 75-77.

Cable and radiotelegraph messages (series R 75-77) include communications sent from, received in, and transiting the United States and its outlying areas. In addition, radiotelegraph messages include ship-shore messages, and domestic telegraph messages handled over radiotelegraph circuits prior to the closure of such circuits on June 30, 1942.
Plant and depreciation figures (series $R$ 79-80) are on the basis of the currently effective systems of accounts. The radiotelegraph accounts became effective January 1, 1940, and the ocean-cable uniform system accounts January 1, 1943 (replacing an earlier cable accounts system promulgated by the ICC, effective January 1, 1914).

The miles of ocean cable (series $R$ 81) as published have been adjusted in view of the fact that some of the cables were reported and tabulated in statute miles rather than nautical miles.

Federal income taxes prior to 1929 are included in operating expenses (series R 84) in amounts which are not ascertainable. The substantial decline in net income in 1912 compared with 1907 may have been accounted for in large measure by the introduction of depreciation charges which were absent from the 1907 accounts.

Included in employees and compensation (series R 87-88) are the foreign employees of the carriers. The reporting dates for number of employees have varied: For 1929-1934, as of the end of June; for 1935-1945, as of the end of December; for 1946-1970, as of the end of October.

R 78. Overseas telephone calls, 1921-1970.
Source: 73d Cong., 2d sess., Report on Communication Companies, House Report No. 1273, pt. III, No. 2, p. 1459 (1935); and American Telephone and Telegraph Company, unpublished data.

Figures include calls to and from ships on the high seas and most international points. Additional data on radiotelephone service are contained in the Statistics of the Communications Industry in the United States. See also Census of Electrical Industries: Telephones and Telegraphs, 1987, table 9.

R 82. Overseas countries served by direct radiotelegraph circuits, 1912-1970.
Source: U.S. Federal Communications Commission, unpublished data (supplemented and confirmed in Report of the Federal Trade Commission on the Radio Industry and Report on Communication Companies, House Report No. 1273, pt. III, No. 1, pp. 990, 998; pt. III, No. 4, pp. 3934, 3948, and 4188).

## R 89-92. International cable and radiotelegraph rates and international telephone rates between New York City and selected cities, 1866-1970.

Source: 1866-1928, scattered sources as indicated below; 19291970, U.S. Federal Communications Commission, unpublished data.
New York to London. The first successful transatlantic cable was laid in 1866. James D. Reid, The Telegraph in America (1886), p. 748, indicates that the first telegraph rate on the cable (presumably New York to London) was $\$ 100$ for 10 words. Three months later, the same source states, the rate was reduced to $\$ 50$ and subsequently to $\$ 25$. By 1868 , the rate for 10 words had declined to $\$ 15.75$, and in 1885 it stood at 40 cents per word. A staff document of American Cable \& Radio, Inc., prepared in connection with FCC Docket No. 8777 (1948) indicates that the Western Union Telegraph Company had a 50 cents per word rate in 1884, and that on December 24 of that year the Commercial Cable Company entered the field with a rate of 40 cents per word. The same source indicates that the cable companies other than Commercial Cable reduced their rates to 12 cents per word on May 6, 1886, and Commercial Cable in turn lowered its per word rate from 40 cents to 25 cents. On September 16, 1887, Commercial Cable further reduced its rate to the 12 cent level. Then on September 1, 1888, all the cable companies raised their rate between New York and London to 25 cents per word.

Exhibit No. 190, introduced by RCA Communications, Inc., in the same hearing (Docket No. 8777) shows the same rates, but with somewhat different effective dates; while William Holmes, History of Telegraph Rates, 1860 to 1913, p. 23, cites rates which differ in part from those shown here.

In 1916, it became possible to send messages from New York to London through Canada via Marconi Wireless for 17 cents per full rate word. According to the Federal Trade Commission Report on the Radio Industry, p. 36, RCA, on March 1, 1920, began transmitting radiotelegraph messages to Great Britain. The rate initially was 17 cents per word, with an increase to 18 cents on January 1, 1921, and to 20 cents on April 15, 1923. At this point the international cable companies reduced their rate to 20 cents to meet the radio competition. Since then, the rates for cable and radio have been identical.

The rate reductions effective May 1, 1945, provided for a uniform 20 cents per word basic rate from the United States "gateway" cities to a large part of the world (see FCC, Eleventh Annual Report for Fiscal Year Ended June 30, 1945, p. 45). Effective May 1,

1946, all international cable and radiotelephone rates were established on a country-to-country basis at 20 cents and 30 cents per word, respectively.
The reductions in rates, effective July 1, 1950, are the result of "unification" of the full rate and the code rate on all cable and radiom telegraph service. The rates were unified at 75 percent of the existing rate per full-rate word. This had the effect of lowering the charge for full-rate messages but increasing the charge for code messages which at that time formed a substantial portion of international telegraph traffic.

New York to Cairo. Telegraphic communication between New York and Cairo began, probably, in 1870 or shortly thereafter. A Commercial Cable Company tariff book, dated January 1903, indicates a rate of 61 cents per word as of that time. A July 1905 tariff book of the Western Union Telegraph Company shows a New York-Cairo rate of 56 cents per word; 25 cents was the rate for the New York-London haul and 31 cents for the rate beyond London. No record has been found of rates in effect between 1905 and 1925. Data since 1925 are from the FCC based on filed tariffs and correspondence with companies.

New York to Tokyo. No specific record has been found dating the beginning of telegraphic communication with Tokyo. In the hearings before the Senate Committee on Foreign Relations, 54th Cong., 1st sess., Senate Document No. 194 (1896), conflicting testimony was presented with respect to the early rates. The Commercial Cable Company tariff book of January 1903 stated that the rate at that time was $\$ 1.76$ per word. Shortly thereafter Commercial Pacific Cable Company opened its trans-Pacific cable and the rate fell to $\$ 1.53$ per word. This rate included 12 cents per word for the domestic landline haul from New York to San Francisco, and $\$ 1.41$ for the San Francisco-Tokyo leg. Report on Communication Companies, 73d Cong., 2d sess., House Report No. 1273, pt. III, No. 4, p. 3926, is the source of the New York-Tokyo rates between 1903 and 1929. FCC is the source of rates since 1929. For data on radiotelegraph rates lower than cable rates prior to 1925, see FTC, Report on the Radio Industry, p. 35, and testimony before the House Committee on the Merchant Marine and Fisheries, pursuant to H.R. 7357, 68th Cong., Ist sess., p. 170.

New York to Buenos Aires. The 1880 rate is stated in the 1956 Annual Report of the American Cable and Radio Corporation to Stockholders, p. 16. Rates between 1882 and 1927 are derived from testimony before the Senate Committee on Interstate and Foreign Commerce, 71 st Cong., $2 \dot{\alpha}$ sess., on S. 6 (1929-1930) beginning p. 2201, and A Half Century of Cable Service to the Three Americas (1928) published by All America Cables, Inc. When radio service was opened in 1924 the rate was fixed at the same level as the existing cable rate. FCC is the source for rates since 1929.

New York international radiotelephone rates to selected cities. The first overseas radiotelephone service was opened on January 7, 1927, between New York and London. Service to Buenos Aires began April 3, 1930, and to Tokyo, December 8, 1934. The circuit to Cairo, opened August 8, 1932, operated via London until January 7, 1946, when a direct circuit to Cairo was placed in operation. As in telegraph, the Tokyo radiotelephone rate included a landline haul charge until 1946 for the New York-San Francisco haul. Initially $\$ 9.00$, the landline charge was reduced to $\$ 6.75$ on July 1, 1937, and to $\$ 4.50$ on August 1, 1940. All radiotelephone rates presented are for 3 minute weekday person-to-person daytime calls. In addition, there are lower night and Sunday rates on some routes, and on three of the routes station-to-station service is available at either a 25 percent or a $33 \frac{1}{3}$-percent discount from the person-to-person rates.

Series R 1-12. Telephones and Average Daily Conversations (Bell and Independent Companies): 1876 to 1970-Con. [In thousands, except series $\boldsymbol{R} \mathbf{2}$ and $\boldsymbol{R} 3$. Census figures in italics]

* Denotes first year for which figures include Alaska and Hawaii. $\overline{\mathrm{z}}$ Ress than 500 . NA Not available.
${ }^{1}$ Beginning 1920, excludes private line telephones and "Bell" figures derived through totaling data for the Bell Systems, the Southern New England Telephone Company, the Cincinnati Bell Inc., and Bell service telephones.
2 Bell System has no operations in Alaska and Hawaii.

Series R 13-16. Telephone Toll Rates Between New York City and Selected Cities: 1902 to 1970
[Rate for station-to-station, daytime, 3-minute call]

[^169]${ }^{4}$ This figure is affected by the $\$ 18,126,223$ loss on the sale of the Western Union cables system recorded as a cables loss and the $\$ 8,250,000$ tax reduction therefore recorded as a domestic telegraph gain.
${ }_{6} 5$ Figures represent net loss.
6 Excludes wire owned and operated wholly by Class I railroads and landwire of ocean-cable companies.

#### Abstract

Represents zero. ${ }^{1}$ Numbers of cable and radio telegraph messages depend on whether they were re ported by what were formerly known as cable or radio carriers. Since 1956, radio carriers have been using circuits in cables in addition to radio for transmission of messages; since 1965, cable carriers have been using radio circuits via satellite relay in addi- n to cables. International Teleghone calls inserted for information purposes only; not handled by International Telegraph Industry. Beginning 1956, includes Alaska, Guam, and Virgin Islands. Excludes calls over landwire to Canada and Mexico

${ }^{3}$ Number of overseas countries served by direct radiotelegraph circuits decreased during the sixties as they were displaced by submarine cable and satellite circuits; even some of the remaining circuits are for fallback use only.
${ }^{4}$ Excludes Federal income taxes.
${ }^{5}$ Prior to 1929 , employment and compensation figures represent incomplete reportings to FCC by all carriers.
cable Figure represents net loss resulting from the sale, charged against income, of a able systerm.

Agures represent net loss.
${ }^{8}$ As of September 16 .

## Radio and Television (Series R 93-162)

## R 93-162. General note.

Federal regulation of radio communication has been continuous since 1912 when the Department of Commerce was given authority to license radio equipment and radio operators, and broadcast stations, which began operation in 1921. On February 23, 1927, Congress established the Federal Radio Commission with broad authority for the regulation of radio. In 1934, the powers of the Federal Radio Commission were transferred to the Federal Communications Commission.

Principal governmental sources of statistics in respect to broadcast and nonbroadcast radio services include the following:

1. U.S. Bureau of the Census, Census of Business, 1995: Radio Broadcasting; Fifteenth Census Reports, Population, vol. VI, Families, 1930; Sixteenth Census Reports, Housing, vol. II, part 1, 1940; U.S. Census of Housing: 1950, 1960, and 1970 , vol. I, part 1.
2. U.S. Department of Commerce, Annual Report of the Secretary of Commerce, 1913-1926.
3. Federal Radio Commission, Annual Report of the Federal Radio Commission, 1927-1933; Commercial Radio Advertising, 1931.
4. U.S. Federal Communications Commission, Annual Report of the Federal Communications Commission, 1938-1970; Report on Chain Broadccsting, 1941; The Public Service Responsibilities of Broadcast Stations, 1946; "An Economic Study of Standard Broadcasting," October 1947 (processed); House Report No. 1297, 85th Cong., 2d sess., Network Broadcasting, 1958.
5. House Report No. 1273, 73d Cong., 2d sess., Report on Communication Companies, 1934.
Since 1937, the FCC has obtained amnual financial reports from networks and broadcast stations. Statistical tabulations of the data so reported have been made available by the FCC in its annual reports; in its annual Statistics of the Communications Industry in the United States; and in annual processed reports. Unlike the telephone and telegraph industries, radio broadcasting is not classified as a common carrier and is not subject to rate or earnings regulation. The FCC, therefore, does not prescribe a uniform system of accounts for the radio industry. However, the Commission's Annual Report Form No. 324, and the accompanying instructions, ensures general uniformity in the reported data. The individual financial reports of networks and stations filed with the FCC are not available for public inspection. However, some individual network and station data have been published from time to time, as for example, in a Committee Print, 84th Cong., 2d sess. (Senator John W. Bricker), The Network Monopoly: Report Prepared for Use of the Committee on Interstate and Foreign Commerce, 1956; Monopoly Problems in Regulated Industries; Hearings before the Antitrust Subcommittee of the Committee on the Judiciary, 84 th Cong., 2 d sess., 4 vols., part 2, 1956.

## R 93-97. General note.

Statistics of broadcast stations are commonly presented in terms of "authorized" and of "licensed" stations. A broadcast station is authorized when it receives a construction permit from the U.S. Federal Communications Commission (or predecessor licensing agencies). Normally, a station is expected to complete construction and begin regular operation within 8 months thereafter. However, not all authorized stations complete this process and be-
come operating stations. This has occurred mainly in the broadcast services of frequency modulation (FM) and television (TV).
Similarly, statistics of "licensed" stations can be misleading. A station permittee who has completed construction in accordance with the specifications of the construction permit or a modification thereof, usually receives a regular license, prior to start of regular on-the-air program service. However, for a variety of reasons, the FCC has permitted stations to undertake regular broadcast service under a Special Temporary Authorization. Many stations have operated under such authority for a number of years. Here, again, this statement applies particularly to FM and TV stations.
Figures for these series are for the most part presented in terms of operating stations. Stations are recorded in FCC records as operating when they have received permission to conduct program tests. In some instances, considerable time may elapse before such stations are in regular, daily operation. Adjustments for this factor have been made by the FCC on the basis of trade sources, and such adjustments are incorporated here. In sum, the data on operating stations are not precise, but are believed to be reasonably accurate.

## R 93. Standard broadcast (AM) stations operating, 1921-1970.

Source: 1921, U.S. Federal Communications Commission, unpublished data; 1922-1926, Annual Report of the Secretary of Commerce, various issues; 1927-1932, Seventh Annual Report of the Federal Radio Cormission for Fiscal Year 1933, p. 18; 1933-1970, FCC, Annual Report, various issues.
Prior to 1948, data pertain to licensed stations which, in the AM service, generally approximated operating stations.

Figures are not available annually on the number of noncommercial AM stations because there is no separate noncommercial service. Usually, such stations are supported by educational or public bodies. In the early growth of radio prior to 1927, educational institutions were prominent in radio (see S. E. Frost, Education's Own Stations; the History of Broadcast Licenses Issued to Educational Institutions, University of Chicago Press, 1937). From 1945-1970, the number of noncommercial AM stations declined from about 35 to 25 . In addition, a small number of educational institutions operate commercial stations.

The decline in the number of AM stations between 1927 and 1929 followed the transfer of the licensing function from the Secretary of Commerce to the Federal Radio Commission. The latter body tightened the licensing requirements, resulting in the withdrawal or deletion of a number of operating stations.

R 94-95. Frequency modulation (FM) stations operating, 1940-1970.
Source: U.S. Federal Communications Commission, Annual Report, various issues.

FM was authorized as a regular service in 1940, effective January 1, 1941, and the first commercial station was licensed in 1941. Noncommercial FM is a separate service with a specific spectrum allocation. The stations are licensed to nonprofit educational organizations.

R 96-97. Television (TV) stations operating, 1941-1970.
Source: See source for series R 94-95.
Television was authorized on a regular commercial basis, effective July 1, 1941, and 2 stations in New York began operating as of that
date. Figures include very high frequency (VHF) stations, first authorized in 1941, and ultra high frequency stations (UHF), first authorized in 1952. Some stations (almost entirely UHF stations) began operation and subsequently ceased operation, but retained their FCC authorization. Such stations are not included in the years of nonoperation.

## R 98-101. Cable television, 1952-1970.

Source: John Blair \& Company, New York, N.Y., Statistical Trends in Broadcasting, annual issues (copyright).
Cable television (CATV) is a system whereby program signals are sent through a cable attached to a television set, as opposed to commercial television and on-the-air transmission of signals.

## R 102-103. Sets produced, 1922-1970.

Source: Electronic Industries Association, 1922-1934, Electronics Industry Fact Book, 1957, pp. 4, 5; 1935-1970, Electronic Market Data Book, 1971. (Copyright.)

Figures are based on reports of members of the Electronic Industries Association (formerly Radio-Electronic-Television Manufacturers Association) adjusted for estimated production of nonmembers. The figures also include sets produced for export. Radio set figures include home sets for all years; auto sets, 1930-1970; portable sets, 1939-1970; and clock sets, 1951-1970. As of 1970, automobile sets constituted over 40.3 percent of total radio-set production. As of 1970, year end, Electronic Industries Association estimated that there were 336 million radio sets in working order in the United States, including 85 million in automobiles.

## R 104. Households with radio sets, 1922-1970.

Source: Annual figures, National Broadcasting Company (NBC), unpublished estimates. U.S. Bureau of the Census data, as follows: 1930, Fifteenth Census Reports, Population, vol. VI, Families, table 39; 1940, Sixteenth Census Reports, Housing, vol. II, part 1, table 10; 1950, 1960, and 1970, U.S. Census of Housing: 1950, vol. I, part 1, table 13; 1960, vol. I, part 1, table 7; 1970, vol. I, part 1, table 34.
NBC accredits data on radio ownership prior to 1950 to the National Association of Broadcasters (NAB), which is the national trade association of broadcasters, and to Broadcast Measurement Bureau, a private survey group, which conducted a detailed nationwide survey of radio listening. A survey conducted by the Columbia Broadcasting System (CBS), the results of which were published as "Lost and Found," purported to show 2,450,000 households with radios not enumerated in the 1930 Census of Population. Accordingly, the NAB adjusted the 1930 census figure to $14,499,000$. Similarly, 964,026 occupied dwelling units did not report concerning radio ownership in the 1940 Census of Population. The NAB estimated that 786,043 of these should be added to the 1940 census figure of $28,048,219$ occupied units with radio.

The figures include radio sets which may not be in working order. Sets temporarily out of order or being repaired at the time of enumeration were included in the census data. The figures exclude radio sets in places of business, institutions, and hotels.

## R 105. Households with television sets, 1946-1970.

Source: National Broadcasting Company, unpublished estimates. U.S. Bureau of the Census data as follows: 1950, 1960, and 1970, U.S. Census of Housing: 1950, vol. I, part 1, table 13; 1960, vol. I, part 1, table 7; 1970, vol. I, part 1, table 34.

An indication of the accuracy of the estimates is provided by several surveys of TV ownership in the Nation's households conducted by the Bureau of the Census for the Advertising Research Founda-
tion. These studies have yielded the following estimates:

|  | June 1955 | March 1956 | August 1956 | January 1969 |
| :---: | :---: | :---: | :---: | :---: |
| Total sets in TV homes | 33,269,000 | 37,277,000 | 39,568,000 | 79,660,000 |
| TV homes. | 32,106,000 | 35,495,000 | 37,410,000 | 58,250,000 |
| Second sets in TV homes -...-- | 1,163,000 | 1,782,000 | 2,158,000 | 21,410,000 |
| TV hormes as percent of total homes. $\qquad$ | 67.2 | 72.8 | 76.1 | 95.0 |

All figures exclude sets in places of business, institutions, and hotels, but include households with television sets which may not be in current working order.

R 106-109 and R 123-126. Radio and television advertising expenditures, 1935-1970.
Source: 1935-1956 and 1958-1968, Printers' Ink Advertisers' Guide to Marketing, various issues; 1957, Printers' Ink, Feb. 6, 1959, p. 9; 1969 and 1970, Marketing Communications, July 1971.

Historical-time series on advertising expenditures were first developed by L. D. H. Weld of the McCand-Erickson Advertising Agency, New York, in 1938. After Dr. Weld's death in 1946, McCann-Erickson continued to prepare the estimates under the supervision of Dr. Hans Zeisel and, since 1950, Robert J. Coen.

Total advertising expenditures in radio and television are total time sales of networks and stations including commissions of advertising agencies and station representatives, as reported by the Federal Communications Commission, multiplied by estimated "adjustment" factors. For a description of the method used in developing the annual adjustment factors, see the source. Total advertising expenditures are larger than total broadcast revenues as reported by the FCC in two respects: The inclusion of commissions paid to advertising agencies and station representatives; and the inclusion of sums paid by advertisers for talent, program, and production to organizations which do not operate networks or broadcast stations (included in the "adjustment" figures).
The networks included in radio are the four national networksAmerican Broadcasting Company ( ABC ), Columbia Broadcasting System (CBS), National Broadcasting Company (NBC), and the Mutual Broadcasting System (MBS). The three large regional networks included for most years are the Don Lee Network, the Yankee Network, and the Texas State Network. The networks included in television are ABC, CBS, NBC (each of which operates a network in both radio and television) and, until September 1955, the DuMont Network. At that time DuMont withdrew from the network field.
For a detailed discussion of the network system, see the FCC and other reports listed in the general note for series R 93-162; and 84th Cong., 2d sess., Robert F. Jones, Investigation of Television Networks and the UHF-VHF Problems; Progress Report Prepared for the Committee on Interstate and Foreign Commerce, 1955.
R 107 and R 124, network expenditures. Figures are total expenditures of network advertisers in radio or television for time (i.e., access to the individual stations broadcasting the program); for the program, including talent and production; and for the production of the commercial announcements. Such sums include commissions to advertising agencies but exclude discounts and allowances received by the advertiser. The figures are before disbursements by the networks to their affiliated and owned stations, and exclude the nonnetwork time sales of the stations owned by the networks.

R 108 and R 125, national spot expenditures. This type of advertising is commonly confused with commercial, or "spot," announcements. The term "spot" in this context refers to the purchase of time by national advertisers on individual stations "spotted" or selected in various communities. Predominantly, the advertiser expenditures are for commercial announcements adjacent to network or other programs carried by the individual stations. In addition, national spot advertisers sponsor programs or purchase "participations" in station-supplied programs. Thus, national spot advertiser expenditures include total time sales (after discounts but
including commissions to advertising agencies and station representatives) multiplied by an estimated "adjustment" factor for program and production.

R 109 and R 126, local advertising expenditures. These include total time sales (after trade discounts but including commissions to advertising agencies) multiplied by an estimated "adjustment" factor for program and production. Local advertiser expenditures are made both in connection with the broadcast of commercial announcements and the supply of a program service. The main distinction between national spot and local advertising is as follows: Na tional spot advertisers are connected with firms or companies which produce or distribute goods or services on a national or regional basis, and which usually place their advertising message on a number of selected stations. Local advertisers are usually local retailers and other organizations whose goods or services are primarily for local distribution. As such, a local advertiser will place his advertising message only on the stations in his community or marketing area. However, in practice, the "national" and "local" categories are not completely differentiated.

R 110-122 and R 127-139. Networks and stations reporting, broadcast revenues, expenses, income, gross investment, and employees, 1935-1970.

Source: U.S. Bureau of the Census, 1935, Census of Business, 1935, Radio Broadcasting, pp. 15, 25; U.S. Federal Communications Commission, 1937-1947, Annual Report, various issues; 1948-1970, AM-FM Broadcast Financial Data and TV Broadcast Financial Data, various issues.
The basic sources of figures shown in the Annual Report are Statistics of the Communications Industry in the United States, annual issues, and processed releases of the FCC.

FCC began the regular annual collection of financial and operating data from networks and stations in 1937. The respondents each year usually include over 90 percent of commercial stations in operation, accounting for well over 95 percent of total industry revenues, expenses, and income. Statistics based on these reports, particularly prior to 1952, have included considerable detail. These statistics have been made available to the public in the Annual Report of the FCC, 1938-1970; Statistics of the Communications Industry in the United States, annual issues; and in processed releases.

R 110-111 and R 127-128, reporting networks and stations. Prior to 1949 the radio data are limited to commercial standard broadcasting (AM) stations and networks operating in the United States, Puerto Rico, and outlying areas. Since 1949, the radio data also include reports of joint AM-FM stations, and reports of FM-only stations. The television data include stations operating in the United States, Puerto Rico, and outlying areas.

R 112-114 and R 129-131, broadcasting revenues. Figures include the amounts received by networks and stations from the sale of time (net of all trade and cash discounts and commissions to advertising agencies and station representatives) and from other broadcast activities as follows: Gross amount received for services of talent under contract to and in the pay of networks or stations; net commissions, fees, and profits for services in obtaining, or for placing with others, talent not under contract to and in the pay of respondent; amounts received for furnishing manuscripts, transcriptions, productions, or other program materials or services; and amounts received for incidental broadcast activities such as charges for studio facilities and special charges in connection with remote broadcasts, fees or other charges for conducting studio tours, and fees or profits received for the right to operate concessions.

R 115-117 and R 132-134, broadcasting expenses. The broad expense categories reported include technical, program, selling, and general and administrative expenses. Among the expenses required to be included are the following: Salaries and wages; talent expenses;
film and transcription expense; commissions to staff salesmen; insurance; depreciation and amortization of broadcast investments; rents paid for use of broadcast property; taxes (other than Federal taxes on income); and losses on notes, accounts, and other amounts receivable.

R 118-120 and R 135-137, broadcasting income. Figures represent net operating revenues (before Federal income tax), excluding income derived by the networks and stations from sources and operations other than broadcasting.

R 121 and R 138, gross investment. Figures represent investment in tangible broadcast property, before depreciation. The FCC report form requires that the costs be reported on an original-cost basis, and not on the basis of cost readjustments resulting from the sales or transfers of stations. Tangible broadcast property includes land and buildings, if owned, and transmitter and studio property; it excludes financial assets and good will. In the case of stations which have been sold, it represents that portion of the price assigned by the licensee to the property. Tangible broadcast property is, therefore, not a measure of total investment in broadcasting.

R 122 and R 139, employees. Figures include all employees, staff and nonstaff, full and part time, not excluding general officers, and other managerial officials, but excluding "uncompensated" employees. Figures for 1935 are employees reported as of the 15 th of each month, summed and divided by $12 ; 1938$, week beginning Dec. 11; 1939-1943, middle week in October; 1944-1946, as of Dec. 31; 1946-1948, middle week in October; 1955-1970, as of Dec. 31.

R 140-148. Safety and special radio stations authorized, by class, 1913-1970.
Source: 1913-1926, U.S. Department of Commerce, Annual Report of the Secretary of Commerce, various issues; 1927-1934, Federal Radio Commission, Annual Report, various issues; 1935-1970, U.S. Federal Communications Commission, Annual Report, various issues.

Prior to 1948, the only data available to measure the use of radio in various nonbroadcast safety and special radio services were the number of authorized stations. The term "station," however, has not had a uniform significance among these services or within the same service over time. Primarily, the term reflects licensing procedures. A station is a single authorization issued by the FCC (or its predecessor licensing agencies) authorizing the use of one or more transmitters on assigned frequencies. A station may include one of the following: One or more transmitters at a fixed (land or fixed stations) location; one or more mobile transmitters; a system including a transmitter at a fixed location and one or more mobile transmitters or one of these in a combination with more than one frequency. Within most of the services, station authorizations have been changed from one to another form in an effort to simplify licensing procedures. As a result, year-to-year changes in the number of stations must be interpreted with caution, particularly if a decrease is shown.

Most of the nonbroadcast radio services are grouped together as the safety and special radio services, which constitute the greatest number of radio stations licensed by the FCC. Utilization of these services by individuals, industry, commerce, and State and local governments cover broad fields of operations in connection with protection of life and property, industrial and agricultural production, transportation, disaster, and civil defense.

R 149-162. Authorized land stations and mobile transmitters in the safety and special radio services, 1948-1970.
Source: See source for series R 140-148.
The distinctive characteristics of a land station are that it is located at a fixed site, has a fixed antenna and a panel control, and is used for communication in the mobile services (aviation, land
transportation, etc.). In the land mobile radio services, a land station is referred to as a base station. Thus, in the taxicab radio service, the base station is used to send and receive communications to and from the associated mobile transmitter-receivers located in the taxicabs. In the marine radio services, coastal stations are examples of land stations, and in the aviation radio services, aeronautical stations are the land stations.

Fixed stations are similar to land stations but are employed in the nonmobile radio services to communicate, or transmit messages, to other land points.
Mobile transmitters, as the name implies, are installed in moving vehicles, or are hand carried or are used as pack set units. They have relatively simple antenna and switching equipment and, in conjunction with a receiver, are used for transmitting and/or receiving information. Such transmitters usually tie in with a land station, the
latter serving as a central control point for communicating with the various mobile units.

One major shortcoming of the transmitter data, however, is that they measure authorized rather than operating transmitters. This divergence is not too great in the case of the land or fixed transmitters. $\mathrm{I}_{\mathrm{t}}$ is estimated that over 90 percent of the authorized transmitters are in operation. However, an entirely different situation prevails with respect to mobile transmitters. The number of mobile transmitters is an approximation of the number of transmitters in actual operation. Approximately 50 percent of the authorized mobile transmitters are included in these figures. Licensees, in applying for authorizations, have wide latitude in estimating the number of mobile units they expect to have in operation within the license period.

[Includes Alaska, Hawaii, Puerto Rico, and outlying areas. See text for series R 140-148 for definition of stations]

1 Data for "Citizens" are included with "Land transportation" before 1960 .
2 Includes Class 2 experimental stations as follows: 46,085 taxicab units and 668
${ }^{3}$ Includes 30,000 Class 2 experimental taxicab units. trucks and buses.

# Postal Service, Newspapers, and Books (Series R 163-257) 

## R 163. Post offices, 1789-1970.

Source: U.S. Post Office Department, Annual Report of the Postmaster General, 1970.
The source also presents a classification of the number of post offices into first, second, third, and fourth class for 1946-1970.

## R 164-165. Revenues and expenditures, 1789-1970.

Source: See source for series R 163.
For 1789-1953, revenues and expenses are stated on a cash basis and therefore include payments and receipts in one year applicable to the expenses and revenues of prior years. For 1954-1962, revenues and expenses are stated on an accrual basis, with expenses reported in the year which gave rise to the earnings, whether collected or accrued. For 1963-1970, revenues and expenses are stated on an accrued cost basis.

Comparability of figures from year-to-year are affected by various factors. For example, the Post Office discontinued payment of subsidies to airlines in 1954; the Department also began receiving reimbursement for penalty and franked mail in 1954, costs which the Post Office had previously absorbed.

Expenses include expenditures for plant and equipment of a capital nature and for inventories and supplies, but no provision for depreciation is made. Expenses also include certain public service costs paid by the Post Office Department, but which the Department considered to be unrelated to the determination of the proper operating costs of the Postal Service. These include unreimbursed services for other Government agencies; specific rate subsidies for mailings of second- and third-class mail by certain nonprofit organizations, free-in-county second-class mail, classroom publications, and mail for the blind; excess rates paid to foreign air carriers; and custodial services for other Government departments and agencies. These costs were estimated to have been approximately $\$ 740$ million for 1970 .

Expenses of the Post Office Department do not include costs applicable to postal operations which are paid by other Government departments and agencies for retirement pay accrual, workmen's compensation and unemployment compensation for postal employees, and certain custodial and maintenance expenses. These expenses amounted to $\$ 424$ million in 1970.

R 166-167. Ordinary postage stamps and stamped envelopes and wrappers issued, 1848-1970.
Source: See source for series R 163.

R 168. Postal cards issued, 1873-1970.
Source: See source for series R 163.
The Government postal card was authorized in 1872. The post card, or private mailing card, was introduced in 1898. The rate for this service has been practically identical with that of the postal cards. Business reply cards and letters as a postal service was initiated in 1928.

## R 169. Pieces of matter of all kinds handled, 1886-1970.

Source: See source for series R 163.
With the establishment of the cost ascertainment system in 1926, data on the volume of mail have been obtained from sample counts
conducted quarterly for one week at representative post offices, ranging in number from 255 to over 500 . These sample data were then projected to include all originating mail at all post offices in the United States. The methods of estimating the number of pieces of matter handled prior to 1926 could not be ascertained. See also general note for series R 172-186.

## R 170. Surplus or deficit, 1926-1970.

Source: See source for series R 163.
The Post Office Department operated with a deficit in fiscal year 1970 as it had in all but a few years of its history. The last period in which there was a surplus was during the three World War II years, 1943 through 1945.

The accounts of the Department are maintained in such a way as to reflect the deficit in three ways-the cash deficit, the operating deficit, and the postal fund deficit. The "cash deficit" represents the excess of disbursements over receipts. The "operating deficit," which is utilized in the series, represents the excess of expense over income. The "postal fund deficit" represents the excess of obligations incurred over postal revenues.

R 171. Sales of postage stamps and other stamped paper, 1937-1970. Source: See source for series R 163.

## R 172-186. General note.

The bulk of postail revenues and postai expenses cannot be allocated directly to the various classes of mail handled or to special services performed.

Postal revenues (except for about 10 percent which can be directly allocated or computed) are derived from postage acquired in the form of stamps and stamped paper and from payments under permits, which may be used by the purchaser generally on any class of mail. The result is a large common pool of revenues from numerous sources. Similarly, the several classes of mail and the special services are to a considerable extent handled by the same employees using the same buildings, equipment, operating facilities, house services, and supplies.
Pursuant to a Congressional Act of February 28, 1925 (39 U.S.C. 826), a regular, continuing cost ascertainment system was established in 1926 to collect and develop data on the revenue received (including volume and weight of mail) and cost incurred by the Post Office Department. This system was succeeded by the revenue-cost analysis system which incorporated incremental costs concepts into the system for the first time. The latter system represents the culmination of many changes and improvements for the Revenue and Cost Analysis Report (formerly the Cost Ascertainment Report).
The statistics of expenses as published annually are subject to later readjustments as a result of increases in the charges of railroad, air, or other transportation services, or increases in the salaries of Post Office Department employees, if such increases are made retroactive to an earlier fiscal year.

## R 172-174. First-class mail, 1926-1970.

Source: U.S. Post Office Department, 1926-1946, Budget Digest, 1949, chapter IV, tables 5-11; 1947-1968, Cost Ascertainment Report, 1956, 1958, and 1968 issues; 1969-1970, Revenue and Cost Analysis, 1970.

Figures cover letters, matter wholly or partially in writing or typewriting, and packages (including local delivery letters), single or double postal and post cards, bills and statements of account, and matter closed against postal inspection. Each piece may not weigh more than 70 pounds or measure more than 100 inches in length and girth combined. Postage may be paid by adhesive stamps, stamped cards or envelopes, meter stamps, or permit imprint. For 1926-1929, domestic airmail could not be segregated and is included with first-class mail. Mail fees are included for 1950-1970. Box rent revenues, previously reported as unassignable are allocated to classes of mail, 1951-1955, and classified with special services for 1956-1970. For 1951-1970, the expense of free mail from members of the Armed Forces is included in first-class mail expenditures.

See also text for series R 188-189.

## R 175-177. Second-class mail, 1926-1970.

## Source: See source for series R 172-174.

Newspapers and periodical publications, both domestic and foreign, which meet all of the requirements set forth in part 132, Postal Service Manual, may be mailed at the second-class rates of postage. Revenues include postage payments (stamps or money order permit) and, since 1932, payment of fees for use of the second-class privilege; transient second-class matter (mailings of second-class publications by other than the publisher or news agents); publishers' second-class matter forwarded or returned, 1950-1970; mailing fees, 1951-1970; and box rent revenue allocation, 1951-1970.

Expenses include cost of publishers' second-class matter forwarded or returned, 1950-1970, and, for 1953-1970, also includes the expense of sending notices to publishers regarding undelivered mail.

## R 178-180. Third-class mail, 1926-1970.

Source: See source for series R 172-174.
Third-class mail embraces all matter less than 16 ounces in weight and not qualifying as first or second class. A significant proportion of the matter mailed under third class is advertising material. Also included are keys, identification cards and tags, or similar identification devices that are without cover and bear, contain, or have securely attached the name and complete post office address of a person, organization, or concern with instructions to return to such address and a statement guaranteeing the payment of the postage due on delivery. In 1928, a special "bulk rate" was made applicable to separately addressed identical pieces of third-class matter mailed at one time. The present law requires such matter be mailed in quantities of at least 50 pounds or at least 200 pieces. Also, there is a single piece third-class rate. Revenues include postage revenues and fees for permits; domestic mail fees, 1951-1970; and box rent revenue allocation, 1951-1970.

Prior to 1953, the revenues and expenses applicable to controlled circulation publications (publications consisting primarily of advertising and distributed free or mainly free) were included with third-class and fourth-class services. For 1953-1970, controlled circulation publications are shown separately.

## R 181-183. Fourth-class mail, 1926-1970.

Source: See source for series R 172-174.
This class includes mailable matter 16 ounces or more in weight, not qualifying as first or second class. The major development in this class of mail was the establishment of the parcel post system effective January 1, 1913. Books, special fourth-class and library rate items, catalogs, and matter for the blind, included in fourth class, carry special rates. Mailers of fourth-class articles may use any method of paying postage. Revenues include domestic mail fees for 1951-1970; box rent revenue allocations, 1951-1970; and special handling fees.

## R 184-186. Domestic airmail, 1929-1970.

Source: See source for series R 172-174.
Since September 1948, domestic airmail includes a parcel post service and since January 1949 airmail postal and post card service. Paid airmail to and from the Armed Forces overseas and the outlying areas of the United States, formerly in international airmail, is included with domestic airmail, 1947-1970. For 1951-1970, airmail expenses include the cost of free mail from members of the Armed Forces.

Airmail expenditures include subsequent payments, as of June 30,1950 , to airlines for retroactive rate increases where effective. The decline in airmail expenses between 1953 and 1954 resulted from the transfer of subsidy payments to airlines from the Post Office Department to the Civil Aeronautics Board effective October 1, 1953. The Cost Ascertainment Report for 1953 and prior years shows division of service costs and subsidy payments.

For 1954-1970, the Post Office Department experimented with the transporting of all mail by air between a number of major cities. Such mail, carrying first-class postage, is counted within first-class service.

## R 187. Post Office employees, 1926-1970.

Source: U.S. Post Office Department, Annual Report of the Postmaster General, 1970.

Included are regular or full-time employees and substitute, hourly rate, and part-time employees. Part-time employees are a substantial part of the Post Office labor force.

Prior to October 1933, the operating force for public buildings housing post offices and other Government agencies was on the rolls of the Treasury Department. On that date, the personnel were transferred to the Post Office Department. This increased the regular labor force of the Post Office Department by 8,000 employees.

R 188-190. Postal rates for first-class mail, letters and postal cards, 1792-1970.
Source: 1792-1956, U.S. Post Office Department, United States Domestic Postage Rates, 1789-1956, table I; 1958-1970, Public Law 85-426 (Postal Policy Act of 1958), Public Law 87-793 (Postal Service and Employee Salary Act of 1962), and Public Law 90-206 (Postal Service and Employee Salary Act of 1967).

The postage rates in effect in 1789 were those fixed by the Continental Congress in the Ordinance of 1782 . These rates were continued until 1792. It was not until 1863 that mail was divided into "classes." In the early days of the postal service the recipient rather than the sender ordinarily paid the postage. In 1847 postage stamps were introduced, and in 1885 compulsory prepayment for all domestic letter mail was established.

The rates shown are for regular service. During the earlier years of the westward expansion, special local rates were often improvised. Thus, the first letter rate on the "pony express," which operated between Missouri and California from 1860 to 1861 , was $\$ 5$ for a half ounce, reduced in May 1861 to $\$ 2$ for a half ounce, and in July 1861 to $\$ 1$ for a half ounce because of a Government subsidy.

A considerable part of the domestic mail service between 1792 and 1863 was carried by ship, and was subject to shipletter rates. These rates are detailed in the source, table II, p. 24. In 1863, a ship and steamboat rate, double the regular rate, was made applicable to domestic mail conveyed by ships not regularly employed in carrying mail. This classification is omitted after 1879 because of its diminishing importance but the double rate is still in effect although little or no matter is mailed under these rates.

In 1863 , first-class mail was defined to include letters and matter wholly or partly in writing, except book manuscripts and corrected proof sheets. In 1872, first-class mail was described as including
letters and all correspondence, wholly or partly in writing, except book manuscripts and corrected proof sheets passing between authors and publishers. In 1879, it was redefined to include letters, postal cards, and all matter wholly or partly in writing, except such writing as is authorized to be placed on mail of other classes. See Jane Kennedy, "Development of Postal Rates: 1845-1955," Land Economics, May 1957 issue, pp. 93-112, for additional materials on postal rates, particularly rates for second-, third-, and fourth-class mail.

R 191. Postal rates for domestic airmail, 1918-1970.
Source: See source for series R 188-189, table III, p. 25.
Until 1948, domestic airmail rates applied not only to letters but also to other mailable matter, including sealed parcels up to specified maxima (prescribed according to weight or according to length and girth). Effective September 1, 1948, an Air Parcel Post Service was established. Matter carried by air weighing 8 ounces or less was classified as "airmail" and over 8 ounces "air parcel post." In 1968, air parcel post and first class mail weighing more than 13 ounces were combined and classified "priority mail."

R 192-217. New books and new editions published, by subject, 1880-1970.
Source: Series R 192 and R 193, 1890, Bookman Literary Yearbook, 1898, Dodd, Mead Co. All other series reprinted from various issues of Publishers Weekly, published by R. R. Bowker Co., a Xerox Education Co., copyright (c) by Xerox Corporation.

Figures represent the number of titles published, not the number of books which were printed. Beginning 1967, books are counted by title rather than by volume. Beginning 1959, United Nations Educational, Scientific, and Cultural Organization definition of a "book" (a volume over 49 pages) was adopted. Previously, all hardbound books and all paperbacks that were specialized (workbooks, laboratory manuals, etc.), over 65 pages, or had mass market distribution, were counted. Years prior to 1959, therefore, are not strictly comparable with subsequent years. The data are compiled from information and actual books submitted to R. R. Bowker Company by the various book publishing firms. The source also contains the number of publications for some foreign nations.

## R 218-223. Newsprint consumption and newspaper pages, 1940-1970.

Source: U.S. Domestic and International Business Administration, unpublished data.

R 224-231. Newspapers-number and circulation of daily and Sunday newspapers, 1920-1970.

Source: Editor and Publisher, New York, N.Y., International Year Book Number, various issues (copyright).
The term "daily" refers to papers that are published either morning or evening. About 90 percent of the circulation figures are credited by the Audit Bureau of Circulations. The remaining 10 percent is based on publishers' statements to the U.S. Post Office Department. The compilation is checked annually with a questionnaire to every daily newspaper in the country. The source also presents data for individual States.

${ }_{2}$ For 1951-1929, domestic airmail included with first-class mail. classes of mail; thereafter, classified as "Special services."

[^173]Series R 188-190. Postal Rates for First-Class Mail, Letters and Postal Cards: 1792 to 1970
[First-class mail as a mail category not officially established until 1863. Ship and steamboat letters, 1792-1863, carried special rates]

${ }^{1}$ The 1940 rate change provided that the $3 \&$ letter rate was not to apply to first-class matter for lecal delivery or for delivery within a county with a population of over million if county was entirely within a corporate city.
${ }^{3}$ A uniform rate regardless of distance, a free city delivery service, and a letter unit o $1 / 2$ ounce instead of the former "single letter" were inaugurated.
4 Rate between any point in the U.S. east of the Rocky Mountains and any State or
Territory on the Pacific. For other rates, see those for 1855 .
${ }^{5}$ A communication of 1 sheet. Proportionately higher rates charged for letters of 2, 3, and 4 or more sheets (packet). 1850 established special rates for the western and southwestern U.S.
in 1825, rates for single letters, 151 to 400 miles, increased to $183 / 4$ cents
${ }^{8}$ Between 1794 and 1863, extra fees were charged for city delivery service. The proceeds went to the letter carrier.

* Denotes first year for which figures include Alaska and Hawaii.
${ }^{1}$ Includes fortnightly.
Series R 244-257. Newspapers and Periodicals-Number and Circulation: 1850 to 1967
[Circulation in thousands. Data for 1947 and 1954 are for establishments having 1 or more regularly paid employees for whom a social security account was maintained at the Burau of Old-Age and Survivors Insurance. Data for $1921-1939$ are for establishments reporting annual receipts of $\$ 5,000$ or more. For prior years the corresponding
limit was $\$ 500$. Circulation figures are the totals of average circulation per issue]

NA Not available. Data are estimates based on the yearly suhscription rate of reporting newspapers, as many small newspapers did not report circulation.
${ }^{2}$ Does not include circulation of "Other" newspapers (series $R 253$ ), not available prior to 1925. ${ }^{3}$ Doe a nailable not include a number of "Other" newspapers (series R 252), not available prior to 1919.
${ }_{4}$ Includes a small number of periodicals.

# Energy 

## S 1-218. General note.

Energy to meet the expanding power needs of our economy has been secured from various animate and inanimate sources. Among those of historical significance, whose use is generally within the control of mankind, are human and animal power; waterpower; windpower; wood and other vegetable matter used as fuel; coal; oil; and natural gas; and, since 1957, atomic energy. Currently, efforts are being made to develop and control solar energy, internal heat of the earth, and, through chemical processing, certain additional natural resources such as shale and sea water. For those interested in developing a comprehensive understanding of power problems the following books are suggested: Eugene Ayers and Charles A. Scarlott, Energy Sources-The Wealth of the World, McGraw-Hill Publishing Company, Inc., New York, 1952; P. C. Putnam, Energy in the Future, D. Van Nostrand Company, Inc., New York, 1953; Fred Cottrell, Energy and Society, McGraw-Hill Publishing Company, Inc., New York, 1955; J. F. Dewhurst and Associates, America's Needs and Resources, A New Survey, The Twentieth Century Fund, New York, 1955; Ali Bulet Cambel, editor, Energy R\&D and National Progress, Government Printing Office, 1964; Hans H. Landsberg and Sam H. Schurr, Energy in the United States, Sources, Uses, and Policy Issues, Random House, New York, 1968; Warren E. Morrison and Charles L. Readling, Energy Model for the United States, Energy Balances for the Years 1947-1965, and Projections and Forecasts, U.S. Bureau of Mines Information Circular 8384, 1968; N. B. Guyol, The World Electric Power Industry, University of California Press, Berkeley and Los Angeles, 1969; M. King Hubbert, "Energy Resources," in Resources and Man, W. H. Freeman and Co., San Francisco, 1969; U.S. Congress, Joint Committee on Atomic Energy, Environmental Effects of Producing Electric Power, selected materials and hearings issued in 4 vols., 1969 and 1970; U.S. Senate, Committee on the Judiciary, hearings of the Subcommittee on Anti-Trust \& Monopoly, Competitive Aspects of the Energy Industry, parts 1 and 2, 1970; U.S. Bureau of the Census, 1967 Census of Manufactures-Fuels and Electric Energy Consumed, Report MC 67(S)4, Government Printing Office, 1971; Joel Darmstadter with Perry D. Teitelbaum and J. G. Polach, for Resources for the Future, Inc., Energy in the World Economy: A Statistical Review of Trends in Output, Trade, and Consumption Since 1925, Johns Hopkins University Press, Baltimore, 1971; National Petroleum Council, U.S. Energy Outlook-An Initial Appraisal (1971-1985), Washington, D.C., 1971; Resources for the Future, Inc., in cooperation with M.I.T. Environmental Laboratory, Energy Research Needs, a report to the National Science Foundation, document No. PB 207-516, National Technical Information Service, Springfield, Va., 1971; U.S. Federal Power Commission, The 1970 National Power Survey, issued in 4 parts, 1971 and 1972; Walter G. Dupree, Jr., and James A. West, United States Energy Through the Year 2000, U.S. Dept. of the Interior, 1972; Edison Electric Institute, Statistical Yearbook of the Electric Utility Industry, New York, annual; U.S. Federal Power Commission, World Power Data, annual; U.S. Bureau of Mines, Minerals Yearbook, vols. I-II combined, Metals, Minerals, and Fuels, annual; United Nations Statistical Office, World Energy Supplies, Statistical Papers, Series J, New York, annual; U.S. Senate Committee on Interior and Insular Affairs, A National Fuels and Energy Policy Study, Pursuant to Senate Resolution 45, 19721974; Federal Power Commission, Natural Gas Survey, forthcoming.
Preparation of historical tables showing energy from various sources and total energy input on a per capita or other basis is complicated. The amounts shown will differ greatly depending on the
basis and point of measurement used. End-use data, for example, will show far larger increases in total per capita over the last 100 years than will data presenting physical measures such as tons, gallons, cubic feet, or B.t.u.'s because of increased efficiency in conversion and utilization.

Data on energy available from mineral fuels, waterpower for electric energy, and fuel wood are shown in series M 76-92. For total waterpower, net imports from waterpower sources in Canada and the energy equivalent of waterpower not converted to electric energy (direct drive from water wheels) must also be considered. Statistics available for power sources not included here are presented in some of the sources cited above. Data on the development and use of energy for power and related purposes are compiled or summarized and published by: Federal agencies such as the Bureau of Mines, Bureau of the Census, Rural Electrification Administration, Bureau of Labor Statistics, Federal Power Commission, Federal Reserve Board, Interstate Commerce Commission; the various trade associations such as the Edison Electric Institute, American Gas Association, Bituminous Coal Institute, American Petroleum Institute; and various technical journals, particularly in their statistical issues.

## S 1-14. Total horsepower of all prime movers, 1849-1970.

Source: 1849-1952, J. F. Dewhurst and Associates, America's Needs and Resources, A New Survey, (c) 1955 by The Twentieth Century Fund, New York, p. 1117; 1955, estimates prepared by John A. Waring for Transactions of Canadian Sectional Meiting, World Power Conference, 1958; 1960-1970, unpublished estimates from John A. Waring.
Data for 1849-1952 for series S 4 (work animals), S 10 (sailing vessels), and S 12 (windmills), as shown on p. 1117 of America's Needs and Resources, are based on data presented in appendix 25-3 of that volume. All other data for 1849-1919 are from C. R. Daugherty, A. H. Horton, and R. W. Davenport, Power Capacity and Production in the United States, Water Supply Paper No. 579, U.S. Geological Survey, 1928. The original data from Daugherty et al. were for 1849 and subsequent 10 -year intervals through 1919. Estimates for 1850 and subsequent 10 -year intervals through 1940 are based on straight-line interpolation of original data.

All data for 1929, 1939, 1950, and 1952 shown in Dewhurst were prepared by John A. Waring. According to Waring, estimates for 1952 as shown in Dewhurst are too low for mines and farms, and too high for railroad locomotives.
A technical and statistical bibliography of early data pertaining to the development of horsepower equipment in the United States appears on pp. 43 and 44 of Daugherty et al. This source also contains a section on the sources and accuracy of the data. The following appraisal of the data appears on p. 21: "In general the accuracy of the statistics presented...increases with each successive decade. The data for the early years are almost wholly estimated, but it is believed that the estimates are supported by bases accurate enough to lend a degree of authenticity to them."

In addition to the classifications shown in series S 1-14, the installed mechanical horsepower in a number of special industries was also calculated for 1960 by Waring, as follows (in thousands): Municipal waterworks pumping engines, 2,188 ; gas utility stations, 1,775 ; natural gas pipeline pumping stations, 6,110; underground gas storage pool compressor engines, 470; petroleum pipeline pumping stations, 4,560 ; standby communications generator sets, 632 ; isolated nonindustrial generator sets, 5,204 ; construction and contractors' building
equipment, 89,182 ; inboard powered motor boats and yachts, 29,870 ; outboard powered motor boats, 60,500 ; portable chain saws, 2,020 ; and power lawn mowers, 36,800 . These total 239,311 thousand horsepower, which, when added to the 1960 total of $11,007,889$ thousand shown in series S 1, result in an aggregate of 11,247,200 thousand horsepower.

S 15-24. Consumption of raw materials in constant 1967 dollars, by broad use classes, 1900-1969.
Source: U.S. Bureau of the Census and U.S. Bureau of Mines, Raw Materials in the United States Economy: 1900-1969 (Working Paper No. 35), table A5.

The raw-materials series presented in the source are regrouped in these series in terms of the major purposes for which the materials are used. This classification represents materials used in the entire U.S. economy, including the raw-materials industries.

Minerals usually used for energy purposes are increasingly being absorbed for nonfuel uses. Some such uses are for synthetic rubber, carbon black, and other chemical raw materials; for lubricants, asphalt, road oil, waxes; and as carbon in iron and electrodes. The approximate significance of such uses is indicated by the following figures:

|  | Mineral fuels used for |
| :---: | :---: |
| Period |  |
| nonfuel purposes as a |  |
| percent of totat mineral |  |
| fuels use |  |

The figures in series S 15-24 exclude such uses from the figures presented for "energy materials" and include them in "physicalstructure materials."

It should be noted that the relative importance of the foods, energy materials, and physical-structure materials segments of the consumption pattern is somewhat infuenced by the consumption of raw materials within the raw-materials industries. The value of purchased feed for farm animals and seed are excluded here. However, the mineral fuels consumed in producing raw materials are included, as well as the indirect consumption of raw materials represented by the capital-goods requirements of the raw-materials industries. Available staff facilities did not permit extensive analysis of the magnitude of consumption of raw materials within the raw-materials industries. It appears, however, that 4 to 7 percent of all energy has been used in mineral-fuel production.

See also series K 392-406, L 56-71, and M 38-53 for raw material consumption by agricultural materials, forest products, and minerals, respectively.

S 25-31. Consumption of fuel resources, by major consumer group, 1947-1970.
Source: U.S. Bureau of Mines, Minerals Yearbook and Mineral Industry Surveys, annual issues.
Most of the uses in the residential and commercial classification have the common characteristic of contributing personal comfort: Lighting, heating, and cooling in homes, schools, theaters, offices, and stores; and the operation of dozens of other appliances from kitchen stoves to office equipment. The line between the two is particularly thin in the case of large apartment houses, which, for the purpose of most energy statistics, are classified as commercial. Industry comprises manufacturing and mining. The transportation category takes in both private vehicles operated by their owners and public transportation-long distance as well as short haul, passenger as well as freight, and water and air as well as land.

Miscellaneous is a "cateh-all" category embracing such diverse uses and users as street lighting, the defense establishment, construc-
tion activities, transportation activities other than those identifiable in published statistics, and agriculture, which includes all uses of energy in farming, etc.

## S 32-175. General note.

Some data on the production and use of electric energy are available since the beginning of commercial production in 1882. Data for 1882-1920, however, are difficult to evaluate because of changing bases of measurement and variations in coverage of the various censuses or other surveys made during the period. The Bureau of the Census published the results of censuses of the electric light and power industries made at 5 -year intervals for 1902-1937, and the reports of the census of manufactures and of mineral industries contain important data on industrial use and production of electric energy. The Geological Survey, the Electrical World (McGraw-Hill Publishing Company, Inc., New York), and the National Electric Light Association also published considerable data applicable to the industry during this early period.

The chief gaps in the data for these years are in the production of electric energy by industrial establishments for their own use, and in the measurement of the sales by electric railroads and railways for public distribution. Early data on capacity must be converted from horsepower (hp.) to kilowatts (kw.) to be comparable; and capacity data in kilovolt-amperes (kv.-a.) were often tabulated as kw. without adjustment for the power factor. Data on generation were also often reported without allowance for the kilowatt-hours (kw.-hr.) used in production and, in many instances, where the prime mover was used both for direct drive and for electric generation, the kw.-hr. equivalent of power used directly was reported as generation. End uses were reported by appliances, as number of lamps, are lights, or motors, rather than as kw.-hr. These variations in units of measurements, in classification, and in coverage often resulted in differences in estimated totals of as much as 20 to 25 percent. In presenting historical data on electric energy since 1902 , efforts have been made to resolve such differences and place the data on a comparable basis.

Referring to various historical sources, one will note that data published in later years will frequently show material revisions to reflect changes in classification and coverage. In the utility series prior to 1945 , for example, when a large generating plant was purchased from an industrial concern, the utility series would be adjusted to include the capacity and generation of this plant in prior years. Where such revisions have been made, the revised data are shown.
Since 1920, comprehensive statistics on capacity and generation of electric utilities for public use have been compiled and published by the Geological Survey for $1920-1936$, and by the Federal Power Commission since 1936. Data on capacity and generation by nonutility establishments since 1939 have been compiled and published by the FPC. The Commission also published financial, operating, sales, and rate statistics for the electric utility industry. Data on customers, revenues, sales, and related matters since 1926 are published by the Edison Electric Institute and the McGraw-Hill Publishing Co., Inc., Electrical World.

During the years there has been a marked growth in the application of power from various fuels through electric energy produced not only in generating plants but by generators in mobile equipment of many types. Among these are power plants in ships, railroad locomotives, trailers, barges, trucks, tractors, buses, and in machines used in mining and heavy construction which produce electric energy for driving and operating the mobile unit and for other services related thereto, or to supplement generating plants for temporary periods. Also of interest are the electric generators for auxiliary purposes operated directly or indirectly by the prime movers in automobiles, airplanes, and other mobile engines or by independent power units in refrigerator cars and trailers and many other installations to furnish electric energy directly or to maintain the electric charge in batteries for use as required. The importance of these small generators is indicated by the fact that the 108 million motor vehicles registered
in the United States in 1970 alone have a total generator capacity in excess of that of all the federally owned electric utilities. Except where large units in the general classification of mobile plants are connected to utility systems for power for extended periods, neither capacity nor generation are included in the data indicating production and use of electric energy in the United States. In some cases, however, industries will report the horsepower of such equipment as driving generators, but, in general, do not indicate power output in kw.-hr.

S 32-35. Net production of electric energy, by electric utility and industrial generating plants, by type of plant, 1902-1970.
Source: Summation of series S 36-43.
S 36-39. Net production of electric energy, by electric utility generating plants, by type of plant, 1902-1970.
Source: 1902-1917, U.S. Bureau of the Census, Census of Electrical Industries: Central Electric Light and Power Stations; 1920-1970, U.S. Federal Power Commission, Production of Energy and Capacity of Plants, monthly and annual reports.

Census data for 1902-1917 were adjusted in some instances for classification and coverage by the late L. D. Jennings of the Federal Power Commission. The figures for electric energy produced by waterpower for 1912 and 1917, for example, differ from those published in Central Electric Light and Power Stations: 1917, table 26, because they have been adjusted to exclude electricity produced by steam and internal combustion engines at plants which also produced energy by waterpower, and energy produced in plants subsequently included in series S 40-43.

For 1920-1970, data are based on monthly reports by electric utilities to the FPC. Coverage is substantially 100 percent. Included are plants of the privately owned electric utilities, the cooperatively owned systems, and the publicly owned electric utilities. The latter group is composed of the following classes: Municipal electric utilities, Federal projects, public utility power districts, and State power projects.

S 40-43. Net production of electric energy, by industrial generating plants, by type of plant, 1902-1970.
Source: U.S. Federal Power Commission, 1902-1941, unpublished data; 1942-1970, Production of Energy and Capacity of Plants, monthly and annual reports.

Data include the generation of electric energy by manufacturing and extracting industries and by electric railroads and railways, but exclude electric energy generated by the following sources: Nonutility generating plants of less than 100 kw . capacity; plants operated by hotels, apartment houses, office buildings, or other commercial, transport, or service establishments; and plants in military installations. The total generating plant generation excluded is estimated at about $1 \frac{1}{2}$ percent of the annual total shown for both utility and industrial plants. This percentage has declined in recent years with the development of mobile type generators.

## S 44-52. Net production of electric energy, by class of ownership, 1902-1970.

Source: Series S 44-51, see source for series S 36-39; series S 52, see source for series S 40-43.

The Federal Power Commission reports cited above show data for "noncentral stations" within the publicly owned group for 1920-1951. This category included plants supplying electric power primarily for such functions as public street lighting, water pumping, and sewage disposal. Such plants were included in municipal or other named classifications effective 1952. A similar adjustment using records available was made for $1920-1951$.

Data for cooperatively owned utilities (series S 47) are shown in the source combined with power districts and State projects. The
separate data for series $S 47$ were obtained from the detailed records of the FPC. These amounts are slightly below those reported by the Rural Electrification Administration, Annual Statistical ReportRural Electrification Borrowers, because a few plants financed by the REA are included in other classifications or are not, for various reasons, included in the FPC totals.

S 53-57. Number of electric utility generating plants, and production per kilowatt of installed generating capacity, 1902-1970.
Source: See source for series S 36-39.
Figures for series S 57 are based on beginning- and end-of-year average installed generating capacity, except for 1902-1920 when capacity as of the end of the year was used.

In counting the number of generating plants, each prime mover type in combination plants was included separately. Generating capacity represents the manufacturer's maximum nameplate rating of generators.

S 58-73. Privately owned electric utility generating plants, by type of plant and plant size, 1920-1970.
Source: U.S. Federal Power Commission, Statistics of Privately Owned Electric Utilities in the U.S., annual issues.

See text for series S 36-39.

## S 74-85. General note.

Gas turbine (plant type) generating capacity is included with steam. Separate data for gas turbines are available from the Federal Power Commission beginning with 1969. Amounts for 1969 and 1970 are as follows (in thousands of kilowatts):

|  | Electric utilities | Industrial establishments |
| :---: | :---: | :---: |
| 1970 | 15,460 | 441 |
| 1969 | 10,094 | 424 |

S 74-77. Installed generating capacity in electric utility and industrial generating plants, by type of plant, 1902-1970.
Source: Summation of series $S 78-85$.

S 78-81. Installed generating capacity in electric utility generating plants, by type of plant, 1902-1970.
Source: See source for series S 36-39.
See also text for series S 36-39.
S 82-85. Installed generating capacity in industrial generating plants, by type of plant, 1902-1970.
Source: See source for series S 40-43.
See also text for series S 40-43.
S 86-94. Installed generating capacity, by class of ownership, 19021970.

Source: Series S 86-93, see source for series S 36-39; series S 94, see source for series $S 40-43$.

See also text for series S 44-52.
S 95-106. Consumption of fuels by electric utilities, 1920-1970.
Source: U.S. Federal Power Commission, Fuel Consumption of Electric Power Plants, monthly and annual reports, and unpublished data.
For series S 105-106, data for years prior to 1940 are from the records of the Federal Power Commission or may be computed from the data shown for fuel used and electric energy generated. For 1920-1938, the distribution of energy generated for plants using two or more kinds of fuel was estimated.
The data are based on individual generating plant reports submitted monthly by all electric utilities to the FPC. Both the pri-
vately owned and publicly owned operations are included. The coal figures include anthracite, bituminous, and lignite coal-processed separately for the detailed report-and small amounts of coke; those for oil include crude oil, fuel oil, distillate pitch, sludge, and small quantities of other liquid fuels. The consumption of gas includes both natural gas and byproduct manufactured gas. In general, the minor fuels are reported in units equivalent to those for the major class of fuel with which they are combined. The quantities of each fuel include the consumption of generating plants operating on a standby or other intermittent basis.
Data on fuels used in industrial electric generating plants are not solicited as many establishments do not keep such records separate from fuels used for other purposes.

Kilowatt-hour production represents the summation of net station output after deduction for energy used in the operation of auxiliary equipment and facilities within the generating plants. Where two or more kinds of fuel are used at a particular plant during the same month, allocation of the kilowatt-hour production to each fuel is reported. Where such allocations are not made by the reporting utility, they are estimated on the basis of the latest available annual average B.t.u. content of each fuel used at that plant and the average B.t.u. per kw.-hr. generated reported for each kind of fuel.

## S 107. Overall heat rate, 1925-1970.

Source: Edison Electric Institute, Statistical Year Book of the Electric Utility Industry, annual issues.

These data are estimates computed by the Edison Electric Institute by the application of an appropriate calorific factor for each fuel in series S 104-106.

## S 108. Annual use of electric energy per residential customer, 19121970.

Source: 1912, U.S. Bureau of the Census, Census of Electrical Industries, 1912; 1917-1925, National Electric Light Association, Statistical Supplement to the Electric Light and Power Industry in the United States, Publication 1106, New York, 1931, p. 27; 1926-1970, Edison Electric Institute, Edison Electric Institute Statistical Bulletin, New York, 1952 and 1970 issues.

Averages are based on data for customers and on use reported by the electric utilities. Data for appliances used and related matters are published annually in the statistical issue of Electrical Merchandising (McGraw-Hill Publishing Company, Inc., New York).

## S 109-111. Percentage of dwelling units with electric service, 19071956.

Source: For census years, U.S. Bureau of the Census, census of housing (decennial) and census of agriculture (quinquennial); for intercensal years, various annual issues of the following: National Electric Light Association, Statistical Supplement to the Electric Light and Power Industry in the United States, New York; McGraw-Hill Publishing Company, Inc., Electrical World, New York (copyright); and Edison Electric Institute, Edison Electric Institute Statistical Bulletin, New York.

Some adjustments for comparability and coverage have been made in the source data by the late L. D. Jennings of the Federal Power Commission.

In the annual Statistical Bulletin of the Edison Electric Institute and in the statistical reports of their predecessor organization, the National Electric Light Association (cited above), data on the electrification of farms (series S 110) are presented. The information shown in these publications includes Bureau of the Census data and data compiled by the Rural Electrification Administration as well as material collected by the Institute or the Association. In the annual statistical numbers of the Electrical World (cited above), data are presented showing the percent of the population living in wired homes (series S 109). These percentages are generally based on the relation between the number of residential electric customers and population
in census years. Percentages presented by the different sources indicated may vary from one to the other for intercensal years, depending on the statistical procedures used to determine the number of farms and dwelling units and related concepts applied. Among the items causing variations in the percentages of farms electrified, for example, are the inclusion or exclusion of farms without permanent dwelling units, farms with their own electric power plants, farms without service where distribution lines are within $1 / 4$ mile of the dwelling unit, or interpolation for the number of farms in intervening years between the various censuses of agriculture. The percentages shown are those considered reasonable and comparable to those for census years.
S 112-115, and S 117. Average price of electricity by class of service, 1907-1970.
Source: 1907-1924, based on a study by W. G. Vincent, Pacific Gas and Electric Company, Edison Electric Institute Bulletin, June 1936, p. 224 (adjusted by the late L. D. Jennings for comparability with the Federal Power Commission series); Federal Power Commission, 1925-1934, annual report, Typical Electric Bills: Cities of 50,000 Population and More (except that average prices have been adjusted from as of October 1, as originally published, to as of January 1 for comparability with the series subsequent to 1934); 1935-1970, Typical Electric Bills, 1964, p. VI and 1970, p. IX.

Prior to 1935 for series S 113-115 and for all years for S 112, the average bills for specified consumption are based on typical bills for residential and industrial service in cities with 50,000 or more inhabitants. These cities include about one-third of the total U.S. population. Beginning 1935 for series S 113-115, typical bills are based on residential service in communities with 2,500 or more population. These communities include about two-thirds of the U.S. population. Commercial and industrial service is still based on service in cities of 50,000 or more inhabitants. Since populations in adjacent areas are frequently served under the rate schedules effective in these cities, the bills reported indicate rate levels applicable to more than 70 percent of the total population.

Specifications for the computation of typical net monthly bills are prepared by the Federal Power Commission. Special rates for refrigeration, cooking, or water heating, where generally applicable, are used in computing the bill. Fuel adjustments, commodity adjustments, and tax adjustments where the tax is imposed upon the utility and not upon the customer, and other similar adjustments, have been included in the computations where applicable. Sales taxes computed separately and added to the bill computed under the rate schedules are not included in the bills reported.

Average bills are determined by multiplying the bill as of January 1 for each city by its population and dividing the sum of these products by the sum of the populations. Where two or more utilities serve a community with different bills, the population for each bill is determined by the proportion of customers served by class of service. For service where bills are presented under more than one rate schedule, the lowest bill generally applicable is used.
S 116, S 118, and S 119. Average price of electricity for all users, by class of user, 1902-1970.
Source: 1902-1925, U.S. Bureau of the Census, Census of Electrical Industries, 1917 and 1922 reports; 1926-1970, Edison Electric Institute, Edison Electric Institute Statistical Bulletin, New York, 1952 and 1970 issues.

These averages indicate the average revenue from electric service and will vary with average use and rate levels.

## S 120. Electric energy, total use, 1902-1970.

Source: Prior to 1955 , summation of series S 121-132; thereafter, summation of series S 121-131.

Total amount is equal to (a) utility sales of electric energy by class of service, plus (b) industrial generation minus sales to utilities, plus
(c) use by utilities except in connection with the operation of generating plants, plus (d) energy furnished others without charge, plus (e) reported losses and unaccounted for, plus ( $f$ ) estimated production for nonutility generating plants not included in industrial generation, series S 40 , minus sales to utilities as shown by utility reports on purchased energy. This total by years was compared with total net generation of utility and industrial plants, series S 32, plus net imports, series S 132, plus estimates of energy produced by generating plants not included in series S 32. Differences of significance were analyzed, sources checked, explanations of the differences considered and adjustments made as necessary to account for all production or use. For 1939-1970, an appreciable portion of the energy estimated for plants not included in series S 32 and related series are variously reported to the Federal Power Commission or available from related material. For prior years, the amount estimated is based on relationships in benchmark years for which census or comparable type data on capacity, production, or use were available.
Beginning 1955, series is more refined, reflecting ultimate use rather than being based on rate classifications. Included is self-generation at Atomic Energy Commission installations; excluded is self-generation at shopping centers, apartment buildings, and offices.

Imports are classified according to ultimate use; "net imports" as a category is not included.

S 121-122. Electric energy, residential and commercial use, 19121970.

Source: 1912-1925, based on McGraw-Hill Publishing Company, Inc., Electrical World, annual statistical numbers, New York (copyright), and U.S. Bureau of the Census, Census of Electrical Industries, 1902-1927, reports at 5-year intervals; 1926-1944, Edison Electric Institute, Electric Light and Power Industry in the United States, New York; 1945-1970, U.S. Federal Power Commission, Sales of Electric Energy by Class of Service, monthly reports.

For 1912-1945, some combinations and adjustments were necessary for comparability with data for later years. These adjustments were made by the late L. D. Jennings of the Federal Power Commission.

Series S 121 includes residential use on farms and in rural areas but does not include (a) residential service charged in the rent of dwelling units, (b) service where energy is submetered by large apartment houses or operators of housing projects, (c) residential service secured in connection with commercial or other enterprises purchasing energy usually under commercial service classifications, or (d) irrigation sometimes included in the sales classification "Rural (district rural rates)." The FPC data include some residential service rendered by industrial and certain classes of publicly owned plants excluded from the Edison Electric Institute series.
Series S 122 includes purchases under commercial rate schedules for residential services by operators of apartment houses or housing projects where electric service is included in the rent of the facilities, and submetered service to small industrial establishments. Generally excluded are sales to very large commercial enterprises included in series S 130.

## S 123. Electric energy, total industrial use, 1912-1970.

Source: Prior to 1963, summation of series S 124 and S 129; thereafter, see source for series S 121-122.

S 124. Use of electric energy for manufacturing industries, 1912-1962.
Source: 1912-1938, based on data in units of horsepower or kilo-watt-hours presented in U.S. Bureau of the Census reports of the census of manufactures; 1939-1962, based on reports of the census of manufactures and U.S. Federal Power Commission report, Industrial Electric Power, 1939-1946, and unpublished data.

Estimates or reported data were checked with information on industrial or large light and power sales of electric energy plus data available or developed for industrial generation with allowances for
data applicable to series S 129, and, to a limited extent, series S 130. Adjustments that appeared reasonable in view of all information available, including that for later years, were made by the late L. D. Jennings of the Federal Power Commission for changes or variations in classification and coverage.

S 125. Use of electric energy for manufacture of nuclear fuels and related products, 1943-1970.
Source: 1943, U.S. Atomic Energy Commission, unpublished data; 1944-1970, U.S. Federal Power Commission, unpublished data.

Data for 1955-1970 were reported by suppliers of major installations of the Atomic Energy Commission and by the Commission itself.
S 126. Use of electric energy for paper and chemical industries, 1912-1954.
Source: See source for series S 124.
The figures combine data for two major industry groups--paper and chemicals; they exclude major nuclear energy projects where included in the chemical industry group.

## S 127. Use of electric energy for primary metals, 1912-1962.

Source: See source for series S 124.
Figures include ferrous and nonferrous metals.
S 128. Use of electric energy for other manufacturing industries, 1912-1962.
Source: See source for series S 124.
S 129. Use of electric energy for extracting industries, 1912-1962.
Source: U.S. Bureau of the Census, 1912-1939, based on Census of Mineral Indusiries, reports for 1919, 1929, and 1939; U.S. Federal Power Commission, 1940-1946, Industrial Electric Power, 1939-1946; 1947-1962, unpublished data.

Data for 1947-1962 are based on generation reported by industrial plants in this classification. Data from trade associations and from technical publications on total output and on electric energy per unit computed for intercensal years for representative establishments were used to check data estimated for these years by other methods.

## S 130. Use of electric energy for miscellaneous light and power, 1912-1970.

Source: See source for series S 121-122.
Figures include uses variously classified as other, industrial or large light and power (but not included in manufacturing or mineral industries), street and highway lighting, other sales to public authorities where service is not rendered under commercial or industrial rate schedules or purchased for resale by publicly owned systems, railroads and railways, interdepartmental or company use or furnished without charge by electric power systems, rural or other sales for irrigation, and generation in generating plants and used by enterprises of various kinds not included in the use classifications shown separately. The figures include energy for certain classes of residential and commercial uses, series S 121-122, as noted for those series, and may also include some manufacturing and extracting plants for which data were not included in these series, S 124-129, for reasons indicated in text for series S 120 .

## S 131. Electric energy losses and use unaccounted for, 1912-1970.

Source: 1912-1936, Edison Electric Institute, Edison Electric Institute Statistical Bulletin, New York, monthly and annual issues, and Electric Light and Power Industry in the United Stutes, annual; McGraw-Hill Publishing Company, Inc., Electrical World, annual, New York (copyright); and U.S. Bureau of the Census, Census of Electrical Industries, 1912-1932, reports at 5-year intervals. 19371970, U.S. Federal Power Commission, unpublished data.

Relation to total energy used varies from year to year with changes in the proportion of energy metered on the low or on the high side of transformers at the point of delivery or at the generating plant, as well as for changes in technological efficiency in the transmission and distribution of electric energy and its relation to the quantities handled.

## S 132. Electric energy, net imports, 1912-1970.

Source: U.S. Federal Power Commission, unpublished data.
Data for 1940-1970 are based on annual surveys for staff use. For prior years, data are based on FPC S-15, Movement of Electric Energy Across State Lines and International Boundaries, 1940, and on historical records and files to include exports and imports for industrial as well as utility purposes. Monthly and annual Electric Power Statistics published by the Dominion Bureau of Statistics, Ottawa, Canada, were also considered. Coverage in reports for the earlier years varied as did the treatment of energy delivered or received on long-term exchange agreements.
Beginning 1955, data classified in ultimate use; "net imports" as a category is not included in total.

S 133-146. Electric utilities-selected balance sheet and income account items of privately owned companies, 1937-1970.
Source: U.S. Federal Power Commission, Statistics of Privately Owned Electric Utilities in the United States, 1971, tables 10 and 13.

S 147-159. Rural Electrification Administration-electric program, summary of operations, 1935-1970.
Source: U.S. Rural Electrification Administration, Annual Statistical Report-Rural Electrification Borrowers, various issues.
The Rural Electrification Administration was established in May 1935, to initiate, formulate, administer, and supervise a program of approved projects with respect to the generation, transmission, and distribution of electric energy in rural areas. Later, the Rural Electrification Administration (REA) was authorized to make loans for a maximum of 35 years with interest at 2 percent per annum for the construction or improvement of rural electric systems.
The following definitions are used by REA:
Borrowers. Organizations, mainly cooperatives, to which loans for extending central station electric service in rural areas are made. Systems. Rural electric distribution, generation, and transmission systems in operation by REA borrowers.
Miles energized. Pole miles of electric distribution and transmission lines in service.
Consumers served. The number of individual customers receiving service by borrowers as of the end of the calendar year.
Energy generated. The kilowatt-hours of energy produced during the calendar year by electric generating plants owned by the borrowers of REA loan funds.
Energy purchased. The kilowatt-hours of energy purchased during the calendar year by REA borrowers from all suppliers. Revenue. Gross revenue received by REA borrowers mainly from the sale of electric energy.

S 160-175. Developed and undeveloped water power, by geographic division, 1920-1970.

Source: U.S. Federal Power Commission, Electric Power Statistics, annual summaries and related monthly reports.
The data for developed water power are based on monthly reports submitted to the Federal Power Commission by the electric utilities. FPC practice is to record generating unit capacity as that given by the manufacturer on the nameplate which is placed on each generator. Included are plants of the privately owned electric utilities, municipal utilities, Federal projects, public utility power districts and State
power projects. For 1946-1970, the data also include hydroelectric plants of industrial establishments based on their monthly reports to the FPC.

The data for undeveloped water power resources are based on river basin studies of the years shown. The discovery of new sites, changing criteria, and re-evaluation of needs, as well as the development of sites and a host of other reasons may cause the listed amounts of undeveloped water resources to increase or decrease from year to year. Therefore, the yearly changes in the figures for undeveloped resources cannot be directly related to the amounts of developed water power resources.

## S 176-189. Natural gas-consumption and value, 1922-1970.

Source: U.S. Bureau of Mines, Minerals Yearbook, annual volumes.
Data on natural-gas consumption and value are collected by annual surveys of oil and gas producers, natural gas processing plants, gas pipeline companies, and gas utility companies with separate reports obtained for each State in which they operate.
Volumes are reported at the pressure base selected by the reporting company; however, prior to 1967, if the reported pressure base deviated more than 5 percent from 14.65 pounds per square in absolute (p.s.i.a.) at $60^{\circ} \mathrm{F}$, it was corrected to this base. Beginning 1967, gas volumes are reported or converted to a pressure base of 14.73 (p.s.i.a.).

S 190-204. Gas utility industry-customers, sales, and revenues, by type of service, 1932-1970.

Source: American Gas Association, Arlington, Va., 1932-1959, Historical Statistics of the Gas Industry, 1965, pp. 163, 213, and 263; 1960-1970, Gas Facts, 1971, pp. 58, 78, and 98. (Copyright.)

American Gas Association (A.G.A.) statistics are based on data provided by individual gas companies to A.G.A.'s department of statistics on the Uniform Statistical Report, a detailed questionnaire distributed annually to the industry. This questionnaire, periodically reviewed by the financial community to insure the inclusion of all items important to security analysis and insurance companies, is also utilized by many gas companies in reporting their operations to the financial community.

Data relating to customers, sales, and revenues are based upon responses submitted to A.G.A. on this questionnaire by gas companies representing 96 percent of the industry. For the small remaining portion of the industry, data have been obtained from reports filed with regulatory commissions, supplemented by investigation of financial publications and other secondary sources.

Revised monthly sales and quarterly customers, sales, and revenues, as well as interim income statements, are based on information previously published in the Monthly Bulletin of Utility Gas Sales, and the Quarterly Report of Gas Industry Operations.
The three rate classifications are:

1. Residential service.
a. Without space heating.

Service to customers supplied for residential purposes (cooking, water heating, kitchen heating, where another fuel is principal heat for premises, etc.) by individual meter in a single family dwelling or building, or in an individual flat or apartment, or to not over four households served by a single meter (one customer) in a multiple family dwelling, or portion thereof. Service for residential purposes supplied to five or more households served as a single customer (one meter) under one rate classification contract is considered as commercial and is counted as only one customer.

Residential premises also used regularly for professional or business purposes (such as a doctor's office in a home, or where a small store is integral with the living space) are considered as residential where the residential
use is half or more of the total gas volume; otherwise, these are commercial.
Dormitories, hotels, religious and eleemosynary institutions (such as orphan homes), boarding and rooming houses, motor courts, camps, etc., are considered as commercial customers for statistical purposes even though they are supplied by the company on a residential rate contract.
b. With space heating.

Service to customers using gas to supply the principal space heating requirements of a dwelling; other residential uses are included if supplied under the same rate classification.
c. Air conditioning service.

Service to customers using gas to supply the principal air cooling requirements of a dwelling; other residential uses (cooking, water heating, etc.) are included if supplied under the same rate classification.
2. Commercial service.

Service to customers primarily engaged in wholesale or retail trade, agriculture, forestry, fisheries, transportation, communication, sanitary services, finance, insurance, real estate, personal services (clubs, hotels, rooming houses, five or more households served as a single customer, auto repair, etc.), government, and to service that does not directly come in one of the other classifications. The size of the customer or volume of use is not a criterion for determining commercial service. The nature of the customer's primary business or economic activity at the location served determines the customer classification. If a particular load to a manufacturing or processing plant represents the cafeteria of the plant, or a heating load, with or without any processing load, whether or not separately metered, the account is classified as industrial service. Gas supplied to commercial customers for air conditioning or space heating is included under com-
mercial service, whether or not supplied under a separate rate contract.
3. Industrial service.

Service to customers engaged primarily in a process which creates or changes raw or unfinished materials into another form or product. This includes establishments in mining and manufacturing. The size of the customer or volume of use is not a criterion for determining industrial service. The nature of the company's primary business or economic activity at the location served determines the classification used. If a manufacturing corporation has only a sales office, no plant, at a particular location, the classification commercial service is used on the basis of primary activity. If, however, the sales office is part of a manufacturing plant, the classification is industrial service. Gas supplied to these customers for air conditioning or for space heating is included under industrial service, whether or not supplied under a separate rate contract.
Other services comprise service to municipalities or divisions (agencies) of State or Federal Governments under special contracts or agreements or service classifications, which are applicable only to public authorities using gas for general or institutional purposes. They exclude sales properly included under commercial or industrial service such as manufacturing arsenals or publicly owned power systems.

- Represents zero.
${ }^{1}$ Excludes loans rescinded. Curnulative as of Dec. 31. Prior to 1948, includes
amounts not yet under loan contract.
2 As of Dec. 31 . Includes data at time of repayment of loan for borrowers whose
loans have been repaid in full.
${ }_{3}$ Excludes energy sales and revenues of power sold by one REA borrower to another, except for $1940-1942$, for which such sales and revenues are included.
${ }_{4}$ Includes rural-nonfarm and farm consumers.

Series S 160-175. Developed and Undeveloped Water Power, by Geographic Division: 1920 to 1970

1 Includes investment and fund accounts, capital stock discount and expense, and reacquired securities.

# Distribution and Services 

## T 1-491. General note.

Users of these statistics are cautioned to keep in mind that data relate to establishments or firms classified under the Standard Industrial Classification (SIC) System (U.S. Office of Management and Budget, Standard Industrial Classification Manual, various issues, Washington, D.C.) as being engaged in wholesale trade, retail trade, or in performing services. As defined in the SIC, services does not inelude finance, insurance and real estate. Data for such estabblishments are included in Chapter X.

Where two or more activities are carried on at a single location under a single ownership, all activities are generally grouped together and the entire establishment classified in its major activity. The activities of leased departments are generally combined with the parent establishment in which they are located. Data as presented for the various censuses and annual data do not include the activities engaged in at administrative offices or in auxiliary establishments. Neither do they include the operations of chain store warehouses.

T 1-14. National income originating in distribution and selected service industries, 1869-1970.
Source: 1869-1929, Harold Barger, "Income Originating in Trade, 1869-1929," Studies in Income and Wealth, vol. 24, Conference on Research in Income and Wealth, National Bureau of Economic Research, Princeton. U.S. Bureau of Economic Analysis (formerly Office of Business Economics), 1929-1963, National Income and Product Accounts of the United States, 1929-1965, table 1.12; 19641967, U.S. National Income and Produet Accounts, 1964-67, table 1.12; 1968-1970, Survey of Current Business, July 1972, table 1.12.

Data for 1929-1948 are based on the 1942 Standard Industrial Classification System (SIC); data for 1948-1970 are based on the 1957 SIC System. For all series, data for 1948 are shown according to both systems. See reference in general note for series T 1-491.

T 15-28. Persons engaged in distribution and selected service industries, 1869-1970.
Source: 1869-1919, see source for series T 1-14; 1929-1970, see sources for series T 1-14, table 6.6.

These fgures are in terms of full-time equivalent employment, which measures man-years of full-time employment and its equivalent work performed by part-time workers. Full-time employment is defined simply in terms of the number of hours which is customary at a particular time and place. For a full explanation of the concept, see U.S. Office of Business Economics, Survey of Current Business, June 1945, pp. 17 and 18.

Unpaid family workers are excluded due to unresolved difficulties in their definition and measurement.

For explanation of the two series presented for 1948, see the text for series T 1-14.

T 29-42. Average annual earnings per full-time employee in distribution and selected service industries, 1929-1970.
Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics), 1929-1963, The National Income and Product Accounts of the United States, 1929-1965, table 6.5; 1964-1967, U.S. National Income and Product Accounts, 1964-67, table 6.5; 1968-1970, Survey of Current Business, July 1972, table 6.5.
For definition of full-time employment, see text for series T 15-28.

Average annual earnings per full-time employee measures wage-and-salary income per man-year of full-time work. Wages and salaries comprise all payments accruing to persons in an employee status as compensation for their work. They include commissions, tips, and bonuses, as well as cash payments commonly referred to as wages and salaries, together with the value of those payments in kind that clearly represent an addition to the recipient's income. Income in kind is valued, so far as possible, at its cost to the employer. Service industries in which it is a perceptible portion of wages and salaries include hotels and other lodging places and educational services.

Series T 29-42 do not include dismissal pay, directors' fees, employer contributions to social insurance funds and private pension plans, nor accident compensation payments.

For further details, see Survey of Current Business, June 1945, pp. 17 and 18.
T 43-57. Distribution and selected services, legal form of organization, 1935-1967.
Source: U.S. Bureau of the Census. 1985, U.S. Census of Business: 1935, Wholesale Distribution, vol. 1, p. 119. 1939, Sixteenth Census of the U.S.: 1940, Census of Business: 1939, vol. I, p. 71; vol. II, p. 200; and vol. III, p. 104. 1948, U.S. Census of Business: 1948, vol. I, p. 6.05; vol. IV, p. 5.02; and vol. VI, p. 5.02. 1954, U.S. Census of Business: 1954, vol. I, p. 5-2; vol. III, p. 7-2; and vol. V, p. 5-2. 1958, U.S. Census of Business: 1958, vol. I, p. 5-2; vol. III, p. 5-2; and vol. V, p. 5-2. 1963, 1963 Census of Business, vol. I, p. 5-1; vol. IV, p. 7-1; and vol. VI, p. 5-1. 1967, 1967 Census of Business, BC67-RS5, p. 5-103; BC67-WS8, p. 8-126; and BC67-SS8, p. 8-57.

Each establishment included in the censuses of business was classified into one of the following legal forms of organization: (1) Individual proprietorship-an establishment owned by one person, who may or may not actively participate in the operation of the business. (2) Partnership-an establishment owned by two or more persons each of whom has a financial interest in and responsibility for the business. Any partner may or may not actively participate in the operation of the business. (3) Corporation-an establishment (other than a cooperative) owned by an organization or company legally incorporated under State laws. In the 1939 and 1948 censuses of business, cooperative associations incorporated under either regular corporation laws or under the special cooperative association laws of the States were classified as corporations. Beginning with the 1954 Census of Business, a separate legal form was established for cooperatives. (4) Cooperative-an establishment owned by an association of customers of the establishment whether or not they are incorporated. In general, the distinguishing features of a cooperative are patronage dividends based on the volume of expenditures by the member, and a limitation of one vote per member regardless of the amount of stock owned. The establishments are open to the public as a rule, but generally are patronized primarily by members of the association operating the business. In the 1939 and 1948 censuses of business, cooperatives were defined as either "corporations," if the cooperative was incorporated, or as "other legal forms." (5) Other legal forms-These are establishments whose legal form of organization is not one of those defined above. Included in this legal form are liquor stores owned or operated by State, county, or municipal governments, and other miscellaneous ownership types such as estates, receiverships, some nonprofit organizations, and joint ventures. In the 1939 and 1948 censuses of business, cooperatives not incorporated were also included in this category.

T 58-78. Book value of inventories at end of year, 1929-1970.
Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economies). Series T 58-66: 1938, unpublished data; 1939-1946, 1969 Business Statistics, p. 63; 1947-1967, 1971 Business Statistics, p. 63; 1968-1970, Survey of Current Business, December 1971, p. 55. Series T 67-69: 1938-1945, 1953 Business Statistics, p. 16; 1946-1947, unpublished data; 1948-1970, 1971 Business Statistics, p. 24. Series T 70-78: 1929-1952, 1957 Business Statistics, pp. 17-20 except for series T 70, T 71, and T 75 for 1947-1952, which are revised figures from unpublished data; 1953-1970, 1971 Business Statistics, pp. 30-33.

In these series, trade inventories are valued at the cost of merchandise on hand; manufacturers' inventories at cost or market price, whichever is lower. About 15 percent of manufacturers' inventories are valued on a last-in-first-out basis; this basis is much less prevalent in trade, although it is used extensively by department stores. Changes in book values reflect changes in unit costs as well as changes in physical quantities.
Retail store inventories, series T $58-66$, for 1938-45 were linked to the census of business for 1939 and 1948, the Internal Revenue Service's Statistics of Income, and Federal Reserve Board data on department store inventories. Data for 1946-1970 are based on sample information which is used to extrapolate year-end estimates from the 1952-1970 Annual Retail Trade Reports of the Bureau of the Census. Adjustments have been made to the data from 1961 forward to make them directly comparable to retail sales estimates derived from a new sample introduced in 1968.
Inventories of merchant wholesalers, series T 67-69, include wholesalers of farm products and raw materials. Figures for 19381946 include some types of nonmerchant wholesalers and are not comparable with data for later years. Figures for 1947-1958 are adjusted to the levels of the 1958 Census of Business sample from data based on samples selected from the 1948 and 1954 censuses of business. Figures for 1959 and later years are based on a sample designed to conform to the 1963 Census of Business. Inventories are valued at the cost of merchandise on hand; changes thus reflect changes in unit prices as well as changes in physical quantities.
Manufacturers' inventories for 1929-1946, series T 70, 71, and 75, and inventories by stage of fabrication for 1938-1952, series T 72-74 and T 76-78, are based on a sample of manufacturing companies. The data were collected by the Office of Business Economics and benchmarked to Internal Revenue Service's Statistics of Income reports. These data are not directly comparable to the series for later years because of differences in the conceptual basis of the two series, particularly in figures for inventories by stage of fabrication. Total manufacturers' inventories for 1947-1970 and inventories by stage of fabrication for 1953-1970 are based on sample reports collected from manufacturers by the Bureau of the Census and benchmarked to establishment data from its Annual Survey of Manufactures, which is benchmarked to the Census of Manufactures.

## T 79-196. Retail establishments, sales, and persons engaged, by

 kind of business, 1929-1967.Source: U.S. Bureau of the Census. 1929, Fifteenth Census of the United States, 1930, Distribution, vol. I, Retail Distribution, part 1. 1933, Census of American Business: 1933, United States Summaries; 1935, Census of Business: 1935, Retail Distribution, part 1, vol. I, U.S. Summary; 1939, Sixteenth Census of the United States, 1940, Census of Business, vol. I, Retail Trade: 1989, part 1; 1948, Census of Business: 1948, vol. I, Retail Trade, General Statistics, part 1; 1954, Census of Business: 1954, vol. I, Retail Trade-Summary Statistics; 1958, Census of Business: 1958, vol. I, Retail TradeSummary Statistics; 1963, Census of Business: 1963, vol. I, Retail Trade-Summary Statistics, part 1; 1967, Census of Business: 1967, vol. I, Retail Trade-Subject Reports.
Stores are classified according to their principal kind of business. Where a number of lines are carried, changes in relative importance
may serve to shift a particular establishment from one category to another between censuses. Sales figures shown are for kinds of establishments, not kinds of products.

Certain of these series have been adjusted or combined for some years prior to 1958, by Professors Charles S. Goodman and Reavis Cox (presently and formerly, respectively) of the Wharton School of Finance and Commerce, University of Pennsylvania, in order to provide historical series that are as comparable as possible. Figures for 1933, in particular, have been adjusted for comparability. The reports of the census of business provide considerably more detail as to kinds of business.

Sales and excise taxes are included in sales figures for 1954 and later years and excluded for 1948 and 1939.

Figures for persons engaged represent the total of the reported number of active proprietors and employees for the week including March 12 for 1967, of active proprietors and employees for the payroll period ended nearest November 15 for 1939-1963, and of active proprietors plus the average annual number of full-time and part-time employees for 1939 and earlier years. Unpaid family workers are excluded from figures for persons engaged.

Establishments without paid employment and with less than $\$ 2,500$ sales were excluded in 1954 and 1958. The 1948 figures exclude stores which operated the entire year but had sales of less than $\$ 500$. The corresponding cutoff point for 1939 was $\$ 100$. Nonemployer establishments which did not operate the entire year were included in 1963 and 1967 if their receipts during the period they operated were at a rate which would have reached an annual total of $\$ 2,500$ or more had they operated the entire year.
There have been many changes in enumeration methods, in accuracy, and in classifications over the years. The principal ones are noted here; others are described in the various census volumes. Users of the data are cautioned to consult original sources for more complete discussion of factors affecting the comparability of data. The 1954 and subsequent censuses were conducted by mail canvasses of all firms included in the active records of the Internal Revenue Service as subject to the payment of Federal Insurance Contributions Act (FICA) taxes and which were in appropriate kind-of-business classifications. Such data cover only firms with paid employees. The nonemployer segment was derived from a 50 -percent sample of 1954, 1958, and 1963 tax returns. This procedure was modified for the 1967 census by the use of tax records instead of census returns for small employers, and the use of tax records for all nonemployers rather than for a 50 -percent sample. The 1948 and earlier censuses were conducted by field enumeration. The differences in enumeration affect particularly the coverage of establishments without easily recognized places of business (e.g., nonstore retailers) and those leaving business prior to the end of the year. The data for the 1954 and subsequent censuses thus have better coverage in these areas. The 1933 and 1935 censuses were not taken under mandatory reporting requirements and may be subject to some underenumeration.
Dairies which processed milk and cream were included as retailers in 1948 and earlier years if the major portion of their sales was by route delivery to the homes of consumers. They were excluded in 1954 and later years.
Nonstore retailers are treated as a separate kind of business for 1954 and later years. For earlier years, such retailers (to the extent enumerated) were classified in their appropriate kind of business. For 1954, each leased department is treated as a separate establishment; for all other years, data for such departments were consolidated with the establishments in which they were located.

Two sets of data are shown for 1948. The data for 1948 (comparable with later years) represent retabulations of 1948 data to make them comparable with later years as to treatment of dairies, nonstore retailers, and cutoff points for tabulation. Similarly, two sets of data are shown for the number of persons engaged in retail establishments in 1939. The data for 1939 (comparable with later years) represent the sum of active proprietors and paid employees for the payroll period ended nearest November 15 and are comparable with
data for 1948 and later years. The figures for 1939 (comparable with earlier years) represent the number of active proprietors and the average number of employees for the year, and are comparable with data for 1935 and earlier years.

## T 197-219. Retail sales of stores of multiunit retail firms, by kind of business, 1929-1970.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics), 1929-1938, unpublished data; 1939-1970, 1971 Business Statistics, p. 64, and unpublished data, except 1970 (new basis) and 1960 (old basis) from U.S. Bureau of the Census, Monthly Retail Trade Report, January 1961 and December 1971 issues.

For 1929-1951, these series were originally designated as "Retail Sales of Chain Stores and Mail-Order Houses" and represent sales of firms with 4 or more retail stores. Data from the census of business for 1929, 1933, 1935, 1939, and 1948 were used as benchmarks. The intercensal estimates were based on sample groups of organizations with 4 or more stores.

For 1951-1970, the series are based on a sample of firms which operated 11 or more retail units in the most recently available census. Adjustments reflecting changes in industry classification, and in the firms to be included in the sample, were made for 1956 based on 1954 census results; for 1960 based on the 1958 census; for 1964 based on the 1963 census; and for 1970 based on the 1967 census.

Since no adjustments were made for entries and exits from the "11 or more" category between censuses, the data shown cannot be subtracted from total retail sales to obtain sales by organizations operating 10 or fewer stores.

## T 220-224. Chains and chain stores, 1872-1928.

Source: U.S. Federal Trade Commission, Chain Stores: Growth and Development of Chain Stores (72d Congress, 1st session, Senate Document No. 100), p. 80.

Figures include chains of two or more stores reporting to the Federal Trade Commission or known to that agency. Grocery and meat chains have been combined with grocery chains. Ready-to-wear chains include men's ready-to-wear chains, women's ready-to-wear chains, and men's and women's ready-to-wear chains but not chains specializing in furnishings, accessories, millinery, and the like, nor dry goods chains whether carrying apparel or not. Data for each of the 26 lines of business shown in the total column are found in the source. The source publication also contains estimates of the number of chain outlets in different years but such data embody substantial estimating difficulties.

T 225-244. Retail trade margins, by kind of store, 1869-1947.
Source: Harold Barger, Distribution's Place in the American Economy Since 1869, National Bureau of Economic Research, Princeton University Press, 1955, pp. 57, 60, and 81 (copyright).
The retail margin estimates are shown as a percent of retail value of sales, and include both net profit and expenses of doing business. With regard to the reliability of the data, the source volume notes that "because of the extremely heterogeneous nature of the source material, it is not possible to offer any measures of dispersion within categories for the data." The source concludes, however, that we may "have some confidence that at least the larger differences reported... have a real existence."

## T 245-271. Retail store sales, by kind of business, 1929-1970.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics), 1929-1938, unpublished data; 1939-1946, 1969 Business Statistics, pp. 58-59; 1947-1967, 1971 Business Statistics, pp. 58-59; 1968-1970, Survey of Current Business, December issues.

Sales figures include multiunit stores. The classification of durable
goods stores and nondurable goods stores is based on the durability of the commodities accounting for a major portion of the sales of each kind-of-business group. Data from censuses of retail trade were used as benchmarks for annual 1929-1946 data. Estimates for intercensal years in this period were developed from sales tax collection data, special Internal Revenue Service compilations, business population trends, the Federal Reserve Board index of department store sales, and data from the Bureau of Public Roads and the American Petroleum Institute. Methods of compilation are described in 1969 Business Statistics, p. 58.

Data for 1946-1961 were based on a new method of estimating retail sales and are not comparable with those shown for prior years. Estimates of retail sales were developed from a sample representing all sizes of stores, firms, or organizations, and all kinds of retail business. These data were not linked to a census of retail trade as were the old, a factor that accounts for most of the difference between the levels of retail sales indicated by the old and new series for 1946. In 1957 the data were revised back to January 1951 to exc.ude milk dealers engaged in processing on the premises. (This change conforms with the treatment of such establishments as manufacturing plants in the 1954 Census of Business.) Data for 1961-1970 refect a new sample design and classification changes resulting from the 1963 census. In addition, data by kind-of-business group were revised by shifting all "nonstore" establishments into the general merchandise group. Nonstore establishments (mail order, house-to-house, and vending machine businesses) were previously shown in such kind-ofbusiness groups as food, eating and drinking places, and furniture and appliance. The sampling procedure for the new series is described in 1971 Business Statistics.

## T 272-273. Index of department store sales and stocks, 1919-1970.

Source: Board of Governors of the Federal Reserve System, unpublished data.
The index for sales is based on the average per trading day. The stocks index is the annual average of monthly data of end-of-month stocks.

## T 274-371. Wholesale establishments, sales, operating expenses, and persons engaged, by kind of business, 1929-1967.

Source: U.S. Bureau of the Census. 1929, Fifteenth Census of the United States, 1930, Distribution, vol. II, Wholesale Distribution; 1933, Census of American Business: 1933, United States Summaries; 1935, Census of Business: 1935, Wholesale Distribution, part 1, vol. I, U.S Summary; 1939, Sixteenth Census of the United States, 1940, Census of Business, vol. II, Wholesale Trade: 1939; 1948, Census of Business: 1948, vol. IV, Wholesale Trade-General Statistics and Commodity Line Sales Statistics; 1954, Census of Business: 1954, vol. III, Wholesale Trade-Summary Statistics; 1958, Census of Business: 1958, vol. III, Wholesale Trade-Summary Statistics; 1963, Census of Business: 1963, vol. IV, Wholesale Trade-Summary Statistics, part 1; 1967, Census of Business: 1967, vol. III, Wholesale Trade-Subject Reports.
Data shown are for wholesale establishments, other than chain store warehouses. Adjustments have been made in the data prior to 1958 for certain years by Professors Charles S. Goodman and Reavis Cox (presently and formerly, respectively) of the Wharton School of Finance and Commerce, University of Pennsylvania, in order to attain maximum comparability,

Data for persons engaged represent the total of the reported number of active proprietors and employees for the week inciuding March 12, for 1967; of active proprietors and employees for the payroll period nearest November 15, for 1948-1963; and of active proprietors plus the average annual number of full-time and part-time employees for 1939 and earlier years.

There have been numerous changes over the years in the definitions of kinds of business, scope of the census (especially size minimums for enumeration), enumeration methods, and completeness of data. The
statistics shown have been adjusted where possible to maintain maximum comparability over time. Significant changes are noted below. For treatment of lesser differences, see source publications.
The 1954 and later censuses were conducted by mail canvass. Report forms were mailed to all firms included in the active records of the Internal Revenue Service as subject to the payment of Federal Insurance Contributions Act (FICA) taxes and which were classified in appropriate kinds of business or were unclassified at the time the forms were mailed. Data for such censuses, therefore, omit all wholesalers who had no employees subject to FICA taxes. The 1948 and earlier censuses were conducted by field canvasses and were restricted to firms which operated from recognizable places of business, whether or not they had any employees subject to FICA taxes. The 1933 and 1935 censuses were not taken under mandatory reporting requirements and may therefore be subject to some underenumeration.

Data for 1954 and later years are for establishments with paid employees. The original 1948 tabulations include all establishments with sales of $\$ 5,000$ or more irrespective of employment. For 1939, the corresponding cutoff point was $\$ 500$. No mention of cutoff point is made in sources of data for years prior to 1939.
The figures for 1948 (comparable with later years) have been revised to reflect 1954 coverage and to incorporate certain changes in classification.
The figures for 1963 (comparable with later years) have been revised to reflect the scope of the 1967 Census of Business. Significant changes are (1) kinds of business data for 1967 are in accordance with the 1967 edition of the U.S. Office of Management and Budget (formerly Bureau of the Budget) Standard Industrial Classification Manual, whereas the 1963 data are in conformity with the 1957 edition and its supplements; (2) the number of paid employees in 1967 was obtained from administrative records of the Internal Revenue Service while, in 1963, all census information was obtained directly from the companies; and (3) the number of active proprietors for 1967 is based on crediting sole proprietorships with one proprietor and partnerships with two proprietors for firms with first quarter 1967 payroll; for 1963, on crediting proprietors similarly but for all sole proprietorships and partnerships operated at any time during 1963.

## T 372-374. Sales of wholesale establishments, 1939-1962.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics), 1939-1946, Survey of Current Business, October 1951, p. 24; 1946-1962, unpublished data (monthly averages published in 1963 Business Statistics, p. 22).
These estimates exclude sales of corporate manufacturers, sales branches and offices, and the marketing stations of petroleum refiners which are included in the manufacturing series of the former Office of Business Economics. Sales of agents and brokers are included here on the basis of actual receipts of the agents and brokers rather than on the total value of goods sold. For 1939-1946, data are based on 1948 Census of Business definitions and classifications. The 1939 census data have been recast to conform to the 1948 census. Data for 1946-1962 are based on definitions and classifications in the 1954 Census of Business, with the 1948 census data adjusted to the scope of the 1954 census.

T 375-383. Sales, stocks, and stock-sales ratios of merchant wholesalers, 1948-1970.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics), 1971 Business Statistics, p. 23.

The estimates are confined to merchant wholesalers since information on other types of wholesalers is not available except for years when the census of wholesale trade was taken. The 1963 Census of Business (to which the merchant wholesale data conform for the period since 1959) indicated that merchant wholesalers accounted for 44 percent of the sales and 74 percent of the inventories of all wholesale establishments.

The data exclude manufacturers' sales branches and sales offices, petroleum bulk stations and terminals, agents and brokers, and assemblers of farm products.
Sales include sales of merchandise and receipts from repairs or other services to customers, after deduction of returns, allowances, and discounts; and sales of merchandise for others on a commission basis. Local and State sales taxes and Federal excise taxes are included. Inventories represent stocks, at cost, of merchandise on hand for sale at the end of the month; they do not include goods held on a consignment basis or such items as fixtures, equipment, and supplies not held for sale.

The stock-sales ratios for a given year are derived by dividing the weighted average of seasonally adjusted end-of-month inventories (using the 13 observations including the yearend figures for the given and previous year) by the monthly average sales for that year. No adjustments have been made to bring inventory book values, which are typically valued at the lower of cost or market, up to the level of selling prices.

Figures for 1948-1958 are based on samples selected from the 1948 and 1954 censuses of business, and were adjusted by the former Office of Business Economics to the level of the sample selected from the 1958 Census of Business and Social Security Administration lists of wholesalers since 1958. These estimates are extrapolations based on data collected by the Census Bureau in the past, compiled with different samples.

In February 1966 a revised sample was introduced which included over 17,000 firms drawn from 1963 Census of Business lists representing all wholesalers (with paid employees) in business in 1963, and Social Security Administration lists of wholesalers (with paid employees) entering business (or requesting new Employer Identification numbers) since 1963. The Office of Business Economics in cooperation with the Bureau of the Census applied ratios calculated from the overlapping data to the previous estimates for 1959 through 1965 to make them comparable with the 1966 figures.

## T 384-390. Wholesale trade margins of independent wholesalers, 1869-1947.

Source: See source for series T 225-244, p. 84.
See text for series T 225-244 for definition of "margin" and statement regarding reliability of the data.
Independent or regular wholesalers are types of wholesalers handling finished goods or construction materials for eventual distribution through some kind of retail outlet. This category excludes other kinds of wholesalers, such as brokers, commission merchants, manufacturers' sale branches, and chain-store warehouses.

T 391-443. Selected service establishments and receipts, 1929-1967.
Source: U.S. Bureau of the Census. 1929, unpublished data; 1933, Census of American Business: 1999, United States Summaries; 1935, Census of Business: 1935, Service Establishments, vol. I, U.S. Summary and Census of Business: 1935, Miscellaneous; 1939, Census of Business: 1939, vol. III, Service Establishments; 1948, Census of Business: 1948, vol. VI, Service Trade-General Statistics; 1954, Census of Business: 1954, vol. V, Selected Service Trades-Summary Statistics; 1958, Census of Business: 1958, vol. V, Selected ServicesSummary Statistics; 1963, Census of Business: 1963, vol. VI, Selected Services-Summary Statistics; 1967, Census of Business: 1967, vol. V, Selected Services-Area Siatistics, part 1.
Certain series have been combined for some years in order to provide as comparable historical series as possible. For some of the series, as noted below, data for some years were collected in other census programs. The series presented here cover that very limited segment of the services sector which bears greatest similarity to retail trade, specifically, personal, repair, and automotive services; hotels; and motels.
There have been numerous changes in enumeration methods, in accuracy, and in classifications over the years. The principal ones
are noted here; others can be noted by reference to the various census volumes. The 1954 and later censuses were conducted by mail canvasses of firms included in the active records of the Internal Revenue Service as subject to the payment of Federal Insurance Contributions Act (FICA) taxes and which were in appropriate kind-of-business classifications. Such data cover only firms with paid employees. The nonemployer segment was derived from a 50 -percent sample of 1954, 1958, and 1963 tax returns. In the 1967 census, data for all nonemployers were compiled from tax records. The 1948 and earlier censuses were conducted by field enumeration. The differences in enumeration methods affect particularly the coverage of establishments without easily recognizable places of business and those leaving business prior to the end of the year. The 19541967 data are thus more complete in those areas. The 1933 and 1935 censuses were not taken under mandatory reporting requirements and may therefore be subject to some underenumeration. There are important gaps in enumerators' reports for 1933 so that substantial underenumeration, particularly of the smaller establishments, exists for 1933. Underenumerations have more effect on the number of establishments than on receipts.
In the 1963 and 1967 censuses, nonemployer establishments which did not operate the entire year have been included if, during the period they operated, their receipts were at a rate which would have reached an annual total of $\$ 1,000$ or more had they operated the entire year. Establishments without paid employment and with less than $\$ 1,000$ receipts were excluded in 1954 and 1958 tabulations. The data for 1948 (comparable with later years) show 1948 figures adjusted to this cutoff point. The data for 1948 (comparable with earlier years) exclude establishments which operated the entire year but had receipts less than $\$ 500$. For 1939 and earlier years establishments having receipts of $\$ 100$ or more are included (except as noted). Where two estimates are shown for 1939, the figures for 1939 (comparable with later years) represent a revision to conform to 1948 kind-of-business definitions.

Receipts for 1954 and later years include sales and excise taxes; receipts for 1948 and 1939 exclude them.

Establishments are classified according to their principal kinds of business. Changes in relative importance may thus serve to shift particular establishments among service categories or between service and retailing classifications from one census to another. Many service establishments derive some receipts from sales of merchandise; conversely, many establishments primarily engaged in the sale of goods, and hence included in retail trade, obtain some income from services. Receipts reported in each case represent total receipts of establishments comprising the classification, not receipts for the particular service indicated.

T 402-403, total personal services. Data for 1933 and 1935 represent groupings that correspond most closely to the 1939 scope.

T 410-411, photographic studios. Since the 1954-1967 data were obtained by mail canvass, they are believed to be substantially more complete than data for earlier years. For this industry, nonrecognizable establishments are likely to result in substantial underenumeration in a field canvass.

T 412-417, laundry, cleaning, and garment services. Included in series T 412 are power'laundries, cleaning plants, press shops, linen supply, diaper service, industrial launderers, garment repair, and hand laundries. For 1933 and 1935, power laundries and dry cleaning plants with receipts of less than $\$ 5,000$ were omitted. While series $T 414$ does not include the count of outlets owned and operated by dry cleaning plants, series $T 415$ does include the receipts of such outlets.

T 426-427, automobile repair shops. Data for 1935 include specialized shops as enumerated in the census of service establishments, and general repair garages as enumerated in the 1935 Census of Business, Retail Distribution, table 1A. Data for 1933 cover only general repair garages, as enumerated in the 1933 Census of American Business, Retail Distribution, table 1A, and the following types of
specialized shops as reported in 1933 Census of American Business, Service Industries: Paint shops, radiator shops, top and body repair shops, tire repair shops, and brake repair shops.

T 434-437, miscellaneous repair services. Separate data are available for some or all of the indicated years for several of the repair services in this group including shops engaged in armature rewinding, bicycle repair, blacksmithing, harness and leather goods repair, musical instrument repair, saw and tool repair, typewriter repair, upholstering and furniture repair, watch, clock, and jewelry repair, etc. Since the 1954-1967 data were obtained by mail canvass, they are believed to be substantially more complete than data for earlier years. In these industries, nonrecognizable establishments are likely to result in substantial underenumeration in a field canvass.

T 438-439, hotels, tourist courts, motels, trailer parks, and camps. Data for 1954-1967 are for establishments with payrolls only.

## T 444-471. Volume of advertising, by medium, 1867-1970.

Source: Printers’ Ink Publications, New York, N.Y., 1867-1934, Printers' Ink Advertisers' Annual, 1955 edition; 1935-1968, Printers' Ink Advertisers' Guide to Marketing, annual issues; 1969 and 1970, Marketing/Communications, July 1971.

The data were prepared by Robert J. Coen of McCann--Erickson, Inc., from information furnished by the American Newspaper Publishers Association, A. C. Nielsen Company, Publishers' Information Bureau, Farm Publication Reports, Inc., the Direct Mail Advertising Association, A. R. Venezian, Outdoor Advertising, Inc., and the Federal Communications Commission.

The data include the cost of preparation, and the cost of talent in the case of radio and television as well as the charges for space and time.

## T 472-484. Indexes of national advertising expenditures, by medium,

 1935-1970.Source: Compiled by Robert J. Coen of McCann-Erickson, Inc., from annual dollar figures prepared and published in Advertising Age, Crain Communications, Inc., Chicago.

The general index, series T 472 , is designed to reflect the changes in advertising dollar expenditures by national advertisers in major media. The national advertiser is usually a manufacturer of a product or service who does business in many markets across the country. National advertisers usually place their advertising through the facilities of an advertising agency and national media sales representative.

The index numbers for all media are based on estimates of the total expenditures made by advertisers to cover space and time charges as well as charges for programming, art and mechanical production expenses, and all commercial production items.

Estimates for the individual media are developed according to several general sources. Broadcast media estimates are derived from the financial reports of the Federal Communications Commission (FCC). The FCC provides comprehensive data on time sales revenue and also program revenue for network television, network radio, spot television, and spot radio. Adjustments are made to these figures to include additional allowances for commercial production expenses and some programming and talent charges not channeled through the stations or networks.

Magazine estimates are primarily based on the reports of the Publishers Information Bureau. Newspaper estimates are primarily based on the reports provided by the Bureau of Advertising of the American Newspaper Publishers Association. Business publications estimates are developed from data collected by the American Business Press. Outdoor estimates are developed from data provided by the Institute of Outdoor Advertising.

The above sources relate to the figures for the most recent years.

In some cases older historical data were derived from sources that are no longer in existence. All data are adjusted and linked in order to make the historical series comparable from year to year.
Data for all media include Alaska and Hawaii as well as expenditures for media in outlying areas of the United States.

T 485-491. Newspaper advertising-linage for 52 cities, 1928-1970.
Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economies). 1928-1938, unpublished data; 1939-1946, 1969 Business Statistics, p. 57; 1947-1970, 1971 Business Statistics, p. 57.

Data represent newspaper linage in all newspapers, daily and Sunday, in the following 52 cities: Akron, Albany, Albuquerque, Atlanta, Baltimore, Birmingham, Boston, Buffalo, Chicago, Cincinnati, Cleveland, Columbus, Dallas, Dayton, Denver, Detroit, El Paso, Fort Worth, Hartford, Houston, Indianapolis, Jacksonville, Knoxville, Los Angeles, Memphis, Milwaukee, Minneapolis, Nashville, New Orleans, Oakland, Oklahoma City, Omaha, Pittsburgh, Portland (Oreg.), Reading, Richmond, Rochester, Salt Lake City, San Antonio, San Diego, San Francisco, Seattle, South Bend, Spokane, St. Louis, Syracuse, Tacoma, Toledo, Tulsa, Washington, Worcester, and Youngstown.

Series T 1-14. National Income Originating in Distribution and Selected Service Industries: 1869 to 1970
[In millions of dollars. Data represent net value added at factor costs]

Series T 274-371. Wholesale Establishments, Sales, Operating Expenses, and Persons Engaged, by Kind of Business: 1929 to 1967-Con.
[Sales in millions of dollars]

* Denotes first year for which figures include Alaska and Hawaii.
${ }_{1}$ Neginning 1954, excludes ready-mixed concrete distributors, no longer part of wholesale trade but included in selected service trade.
2 Includes subclasses not shown separately.
${ }_{3}$ For workweek ended nearest March 12.
${ }^{4}$ Comparable with later years.
${ }^{6}$ Data for series T $274-279$ for 1939, 1933, and 1929 are revised; revised data for other series for these years not available.

Average annual number of full-time and part-time employees.
${ }^{8}$ Aresh fruit and vegetable wholesalers and poultry and dairy products distributors. Milk bottling plants are included in the 1948 (unrevised) and earlier data.

Includes dressed furs.
${ }_{10}$ Includes 42 distilled spirits wholesalers with sales of 13 million dollars and operating expenses of 24.7 percent.

1 Beginning 1954, includes musical instruments and sheet music wholesaiers.
12 Beginning 1948, includes air conditioning and ventilating equipment distributors. Such distributors were classified in the plumbing and heating category in earlier years but were of negligible importance.

Series T 372-374. Sales of Wholesale Establishments: 1939 to 1962
[In billions of dollars]

# International Transactions and Foreign Commerce International Transactions and Foreign Aid (Series U 1-186) 

## U 1-74. General note.

This section presents statistics on the balance of international payments and the international investment position of the United States. Separate tables show the value of U.S. direct investments in foreign countries and of foreign direct investments in the United States, both by area and industry groups. The balance of international payments shows the economic transactions between residents of the United States and those of all other areas of the world during a stated time period. The international investment position indicates the value of U.S. investments abroad and of foreign investments in the United States at specified points of time. The change in the international investment position of the United States results partly from the movement of foreign and U.S. capital, as presented in the balance of international payments, and partly from other factors, such as changes in the valuation of assets or liabilities, including changes in the market value of securities, defaults, expropriations, writeoffs, and reinvested earnings of subsidiaries operating abroad and of foreign subsidiaries operating in the United States. U.S. direct investments in foreign countries include all foreign enterprises whose voting stock is owned to the extent of at least 25 percent by U.S. organizations or individuals, or in the management of which Americans have an important voice. In addition, they include unincorporated foreign branches or other direct foreign operations of U.S. interests, including mining claims, oil concessions, and other property held for business purposes such as real estate. Similarly, foreign direct investments in the United States cover U.S. business enterprises, including real estate investments, in which there was a foreign interest or ownership of 25 percent or more.
In all the series of this section, international organizations, such as the International Monetary Fund, the International Bank for Reconstruction and Development, and the United Nations, though located within the United States, are considered extra-territorial. Consequently, transactions between the United States and these organizations are considered international transactions of the United States, while transactions between them and foreign countries do not enter the balance of payments of the United States. U.S. holdings of their obligations and U.S. liabilities to them are part of the U.S. investment position.

## U 1-25. Balance of international payments, 1790-1970.

Source: U.S. Office of Business Economics, 1790-1918 (except series U 24, 1874-1900), unpublished data; series U 24, 1874-1900, U.S. Department of the Treasury, Annual Report, Director of the Mint, 1921, p. 130. U.S. Bureau of Economic Analysis (formerly Office of Business Economics), 1919-1945, Balance of Payments Statistical Supplement, 1958, pp. 10-13; 1946-1970, Survey oj Current Business, June 1970, p. 34; October 1972, pp. 26-27; June 1972, pp. 26 and 30.
Basically the figures for 1790-1918 are from publications by private authors; therefore, they are unofficial figures. However, the figures, as shown by these authors, have been rearranged and adjusted, and in some cases supplemented, for this volume by the former U.S. Office of Business Economics (OBE). The reclassified figures fit into the concepts and framework currently used in the official balance of payments statements prepared by OBE.
The original figures are from the following private publications:

1790-1860, Douglass C. North, "The United States Balance of Payments, 1790-1860," Studies in Income and Wealit, Princeton University Press, vol. 24, 1960; 1861-1900, Matthew Simon, "The United States Balance of Payments, 1861-1900," Studies in Income and Wealth, Princeton University Press, vol. 24, 1960; and 1901-1918 (with the exception of exports and imports of merchandise trade and silver), Paul D. Dickens, "The Transitional Period of American International Financing, 1897-1914" (unpublished doctoral dissertation, George Washington University, 1933), and C. J. Bullock, John H. Williams, and Rufus S. Tucker, "The Balance of Trade of the United States," Review of Economic Statistics, July 1919. Data on merchandise trade and silver for 1901-1918 were taken from Department of Commerce, Monthly Summary of Foreign Commerce, various issues.

The estimates for 1901-1918 were revised primarily to make them consistent with, and to link them to, data prepared for subsequent years. The revised estimates were published by Raymond $W$. Goldsmith in Study of Savings in the LInited States, Princeton University Press, 1956, vol. 1, pp. 1078, 1080, 1081, 1084, and 1086.

The Department of Commerce began its series in 1922, later extending the data backward to cover 1919-1921. Data for quarterly U.S. international transactions, total and with individual regions of the rest of the world, are available currently in the March, June, September, and December issues of the Survey of Current Business.

The balance of payments statement reflects all the exchanges of goods, services, gold, and capital claims between residents of the United States and residents of all other areas of the world. Since 1919, residents of the United States comprise residents of conterminous United States, Alaska, Hawaii, Puerto Rico, American Samoa, and Virgin Islands. Beginning 1940, residents of the Panama Canal Zone are also included. As noted above, international organizations are not regarded as residents of the United States.

Transactions entering into the balance of payments are divided into four categories-goods and services, unilateral transfers, capital movements, and transactions in U.S. official reserve assets. The balance of payments statement is built on a double entry system, whereby, in principle, every transaction is recorded both as a debit and a credit. Debits represent increases in assets or decreases in liabilities, and credits represent decreases in assets or increases in liabilities. Thus, an export of merchandise in return for a check drawn on a foreign account in a bank in this country results in a credit for the export (a reduction in an asset) and a debit for the reduction in foreign-held bank deposits (a reduction in a liability). Unilateral transfers to foreign countries (payments) are debits (as are expense items in accounting), and unilateral transfers from foreign countries (receipts) are credits (as are income items in accounting). While all transactions have a debit and credit phase which are necessarily equal, both sides are not estimated simultaneously nor from the same sources, hence, the possibility of error. The resulting discrepancy, referred to as "errors and omissions," series U 25 , is given a plus or minus sign, depending upon which is necessary to make the accounts balance.

The procedure generally followed by North and Simon in their studies was to estimate receipts and payments on account of merchandise trade, transportation, travel, interest, dividends, and remittances. The authors then assumed that the balance indicated net flows of U.S. and foreign capital. For 1790-1900, series U 18-23
represents this balance which, of course, includes any errors and omissions in the estimates.

Data on exports and imports of merchandise used in the study by North are reported to include gold and silver prior to 1821 (see Statistical Abstract of the United States, 1957, p. 890). A separate estimate, however, was made by North for net movements of gold, because he concluded on the basis of his research that specie movements were in fact not included in the merchandise trade figures prior to 1821. (See "The United States Balance of Payments, 1790-1860," pp. 24-25.) This estimate is included in series U 2 and U 9. Although the annual amounts are small, varying from net exports of $\$ 1$ million to $\$ 2.5$ million to net imports of $\$ 1$ million to $\$ 4$ million, the residual item, or net movement of capital, may be in error by the same amount.

North indicates that the reliability of the data on exports prior to 1820 is doubtful and that data on imports are incomplete. The paucity of information also made the estimates for other transactions for this period considerably less satisfactory than for subsequent years. Consequently, North suggests that 5 -year averages may be more reliable than the annual data. Such averages are included in his study.

For the classification and contents of series U 1-25, 1900-1918, see Raymond W. Goldsmith, cited above. Three transactions have been entered which did not appear in this study. See text below for series U 17 and U 18 .

For methods of estimating later data, see Balance of Payments of the United States, 1949-1951, a supplement to the Survey of Current Business, Office of Business Economics. Continued changes and improvements in the methods of collecting data have been made and the figures have become progressively more reliable over time. For an evaluation of data for recent years, see Report of the Review Committee for Balance of Payments Statistics to the Bureau of the Budget, The Balance of Payments Statistics of the United States: A Review and Appraisal, April 1965.

U 2 and U 9, merchandise. The estimates for ship sales for 1790-1900 are included in exports, series U 2. For 1790-1819, the net export or import of specie is included in series $U 2$ or $U 9$, respectively. The gross movements of specie were not available. For 1820-1860, exports of specie are included in series U 2 and imports in series U 9. Exports and imports of gold for 1861-1873, of nonmonetary gold for 1874-1900, and of silver for 1861-1900 are included in series $U 2$ and $U 9$, respectively.

The data for 1901-1918 include merchandise trade proper, silver, and nonmonetary gold. The basic data on merchandise trade for 1919-1970 are the official trade statistics published until 1965 in Foreign Commerce and Navigation and since then in the foreign trade reports of the Bureau of the Census. For 1919-1970, adjustments in both exports and imports have been made to correct for known overvaluation or undervaluation, to exclude noncommercial items, to include an estimate for unrecorded trade, and to adjust for certain differences in territorial coverage, e.g., to exclude the trade with the Panama Canal Zone, beginning with 1940. For World War II and early postwar years, data on Government purchases were substituted for certain import data. For Government-financed transfers of merchandise, the figures based on fiscal records were used instead of the figures appearing in the recorded export statistics. For the years after World War I and World War II, sales and other transfers of surplus property located abroad were added to recorded export statistics. Prior to 1946 , series U 2 also includes the transfers with or without compensation to allied countries of military equipment, including that purchased abroad under the Mutual Defense Assistance Program. A small amount of services connected with these transfers was also included. Series U 2 and U 9 include nonmonetary movements of gold. For the treatment of gold, see series U 24 below.

U 3 and U 10, transportation. For 1790-1819, series U 3 represents gross earnings on freight carried in U.S. ships. Some adjustment was made to eliminate earnings from ships carrying U.S. imports.

For 1820-1860, series U 3 includes earnings by U.S. ships from carrying U.S. exports and from carrying freight between foreign ports. It also includes American port charges paid by foreign ships. Transportation payments, series $U 10$, consist of freight payments to foreign ships for carrying U.S. imports, and expenditures of American ships in foreign ports. Port expenditures and receipts are estimated as a percentage of freight earnings by American and foreign ships, respectively. (Fare payments to American ships by immigrants are included in the estimate for immigrant funds. See discussion of series $U$ 16, private unilateral transactions. For fare payments of tourists, see discussion of travel, series $U 4$ and $U$ 11.) For 1861-1900, series U 3 includes ocean freight earnings from carrying U.S. exports and from carrying freight between foreign ports, and port expenditures in the United States of the foreign merchant marine and of passenger steamships. The estimates for the years 1871-1900 also include earnings from carrying overland freight. Payments for transportation, series U 10, includes ocean freight payments on U.S. imports, and expenditures in foreign ports by the U.S. merchant marine. Passenger fares are included in the travel account (series U 4 and U 11). The data for 1900-1918 include receipts and payments on account of ocean freight, and port charges. For 1916-1918, payments for charter hire were added.
For 1919-1970, the transportation category includes international freight, fares and shipboard expenses of travelers, revenues and expenditures resulting from the charter of vessels and the rental of freight cars, and the expenses of U.S. transportation companies abroad and foreign transportation companies in the United States. The data cover air and surface transportation.

U 4 and U 11, travel. For 1790-1819, no estimate was made for international travel expenditures. For 1820-1860, series U 4 includes tourist expenditures in the United States and their fare payments to American ships; series U 11 represents American tourist expenditures abroad. North assumed that American tourists going abroad and, for the most part, foreigners coming to the United States traveled on American ships during this period. The method employed in the source study for estimating tourism precludes the transfer of fare payments to the transportation account. For 1861-1900, series U 4 includes outlays of foreign travelers in the United States. It was assumed that alien travelers came to the United States on foreign lines and, therefore, no estimate was made for receipt of fares. Series U 11 includes payments abroad by American tourists for maintenance and for ocean fares. Simon assumed that the bulk of the travel during 1861-1900 was on foreign ships. The outlays for procurement of sundry items and luxury consumption goods were not included in his estimate for expenditures abroad by American tourists.

The data for 1900-1918 include fares paid to U.S. ships by foreign tourists and to foreign ships by U.S. tourists.

For 1919-1970, all expenditures made in the United States by foreign residents, except those of diplomats and other official personnel stationed here, are included in the travel receipts. Expenditures made in foreign countries by U.S. travelers for food, lodging, amusements, gifts, and other personal purchases constitute travel payments. Expenditures for transportation within or between foreign countries when purchased abroad are, in general, included as travel expenditures. However, passenger fares for overseas transportation to the ultimate destination (even if the ticket permits stopovers enroute) when paid to foreign carriers by U.S. residents, and when paid to U.S. carriers by foreign residents, are included in the transportation account.

U5, U 6, and U 13, income on investments. For 1790-1900, series U 13 represents net payments of income on investments by the United States. The income was computed by applying an assumed yield rate to the net indebtedness of the United States.

For 1900-1918, separate estimates were made for receipts and payments. Series U 5 for 1915-1918 includes income on private and Government war loans. See Goldsmith, cited above, p. 1078.

For 1919-1970, income includes all interest, dividends, and branch
profits effectively paid or credited during the period, after payment of all taxes in the country in which the payer of income resides.

Private income, series U 5, for 1919-1970 includes interest, dividends, and branch profits from direct investments, and interest and dividends received from holdings of foreign bonds by residents in the United States, from stocks issued by foreign corporations which are not U.S. direct investments, from loans by banks and other financial or commercial organizations, from miscellaneous assets such as commercial real estate, insurance policies, commercial claims of various kinds, trusts and estates, and mortgages. Reinvested earnings, or the parent company's equity in the undistributed earnings on common stock of foreign subsidiary companies, are not included except for 1919-1929. Reinvested earnings are, however, regularly tabulated and used for computing changes in the international investment position of the United States.

Government income, series U 6, for 1919-1970 includes interest received by the U.S. Government on long- and short-term loans and other investments.
Income payments, series U 13, for 1919-1970 include payments of interest, dividends, and branch profits by foreign direct investment companies in the United States, interest and dividend payments to foreign holders of other American bonds and stocks (including U.S. Government securities), and payments of income on various miscellaneous assets such as estates and trusts.

U $\mathbf{7}$ and U 14, other transactions. Marine insurance and brokers' commissions constitute series $U 14$ for 1790-1819. No estimate was made for these transactions between 1820 and 1860. For 18611900, series U 7 consists of receipts on marine insurance; series U 14 comprises payments for marine insurance and net payments for brokers' commissions.
For 1900-1918, no estimates were made.
For 1919-1970, the coverage of miscellaneous service items has expanded and now includes receipts and payments from insurance transactions, communications, management services, motion picture and other royalties; receipts from fees of American engineering, construction, and consulting firms, from foreign contracts, from foreign governments in the United States, and expenditures of U.S. Government agencies abroad, except expenditures by the Department of Defense. The latter is included in series $U$ 12, while receipts from abroad by the military agencies are included in series U 2 .
U 12, military expenditures. This item includes direct outlays by the military agencies in dollars and in foreign currencies, as well as expenditures in the foreign economies by troops, civilian personnel of the military agencies, and post exchanges. It does not include expenditures of deutsche marks received from the Federal Republic of Germany or of yen received from Japan for the support of Allied and U.S. Forces stationed in the respective countries. Offshore procurement under military assistance programs and the purchase of goods and services to be transferred to other foreign countries under aid programs are included in the expenditures by military agencies.

U 16-17, unilateral transfers, net. No estimate was made prior to 1820 for series U 16. For $1820-1860$, series U 16 represents the excess of funds brought into the United States by immigrants and their fare payments to American shipping companies over the amounts remitted abroad after their arrival in this country. For 18611916, series U 16 consists of the immigrant remittances and funds carried by immigrants into the country ( + ) and out ( - ). The estimate for immigrant remittances includes remittances through banks and an estimate for outlays by U.S. residents for prepayment of passage for friends and relatives planning to emigrate to the United States. For 1917 and subsequent years, remittances in cash and kind by religious, educational, and charitable institutions are also included. For series U 17, the entries of $\$ 0.6$ million for 1794-1796 represent annual payments to the Barbary pirates. The payment of $\$ 11.2$ million in 1803 was to France for the purchase of Louisiana Territory. The United States acquired sovereignty over this territory in 1803 and issued bonds for the amount of the purchase. These
bonds carried an interest rate of 6 percent per year and were redeemed between 1812-1823. The interest during this period amounted to $\$ 8.2$ million, $\$ 5.6$ million of which was paid in the first 10 years. (See E. M. Douglas, Boundaries, Areas, Geographic Centers and Altitudes of the United States and the Several States, Washington, D.C., 1930.) Presumably the interest is included in the estimate for income payments, series U 13. The entries of $\$ 5.5$ million for $1836-1838$ represent receipts by the U.S. Government from France on behalf of American citizens in satisfaction of claims for indemnities arising from the Napoleonic wars. (See J. T. Adams, ed., Dictionary of American History, Scribner's, New York, 1940, vol. II, p. 348.) Interest of $\$ 0.5$ million ( $\$ 0.3, \$ 0.1$, and $\$ 0.1$ million for $1836-1838$, respectively) is included. In 1848, at the end of the Mexican War, the United States and Mexico signed the treaty of GuadelupeHidalgo which gave to the United States the present States of Arizona, New Mexico, California, Nevada, Utah, and Colorado west of the Rockies. The payment by the United States of $\$ 15$ million for this territory, plus interest of $\$ 1.4$ million, is represented by the entries for 1849-1852. These entries were referred to in the study, "United States Balance of Payments, 1790-1860," as indemnity payments and entered in the capital account. The entries for 1854-1856, aggregating $\$ 10$ million, represent the Gadsden purchase. Russia, in March 1867, agreed to sell Alaska to the United States for $\$ 7.2$ million in gold. The United States took possession in fiscal year 1868, but payment was not made until fiscal year 1869. During the Civil War, Great Britain had sold to the Confederate States ships which were used as privateers to sink the Union ships. An international tribunal in 1873 held Great Britain liable to the extent of $\$ 15.5$ million. Payment was made to the United States in 1873, as indemnity on behalf of its citizens. The treaty of peace with Spain in 1898, as a result of which the Philippines, Guam, and Puerto Rico were ceded to the United States, stipulated a payment to Spain of $\$ 20$ million.
The figures for series U 17 include two transactions which are not included in Goldsmith's Study of Saving . . ., mentioned earlier for the 1900-1918 period. In 1904, the U.S. Government paid $\$ 10$ million to the Republic of Panama for lease of the Panama Canal, and in 1917, the United States bought the Virgin Islands from Denmark for $\$ 25$ million. These transactions appear in series $U 17$.

For 1919-1970, series U 17 consists of Government transfers of goods, services, or cash, in both dollars and foreign currencies, for which payment by the foreign country has not been made, is not expected, or has not been specified, less reverse lend-lease, counterpart funds on certain foreign-aid programs, and other receipts. Series U 17 alsc includes Government payments of pensions, receipts or payments for idemnities, intangible rights, or other considerations.
U 18-23, U.S. capital flows, net, and foreign capital flows, net. For 1790-1900, the data for series U 18 and U 23 represent the net flow of U.S. and foreign capital, and were estimated as residuals, to balance the other items in the balance of payments. Consequently, they reflect errors and omissions in the estimates of the other items. For some of these years, particularly $1861-1900$, the data shown here differ from those in the source studies because of adjustments in some of the other series. For 1900-1918, see Goldsmith, cited above, pp. 1080-1081.
In 1904, the figure for series $U 18$ includes the payment by the U.S. Government of $\$ 40$ million for the original Panama Canal Company. This transaction was not included in Goldsmith's Study of Saving.
For 1919-1970, the data for series U 18-21 represent changes in assets or in investments of the United States abroad. The long-term transactions represent shifts in capital claims of indefinite maturity or of a stated original maturity of more than one year from the date of issuance. Short-term transactions represent changes in claims on foreigners with a maturity of one year or less. For 1919-1970, series $U 18$ (long-term) includes disbursements of foreign loans, net of repayments, by all U.S. Government agencies, whether made in dollars or in foreign currencies. Also included are movements of
capital related to the operation by the U.S. Government of productive facilities abroad, and U.S. capital contributions to international organizations such as the International Monetary Fund, the International Bank for Reconstruction and Development, and the International Finance Corporation. Loan operations between these organizations and foreign countries are not included since such organizations are regarded as foreign entities in the U.S. balance of payments. Loans made by private banks and guaranteed by the Export-Import Bank are included in series U 20. Real property purchased by the Government for administrative purposes is included in series U 14, other transactions, while all expenditures of religious, educational, and charitable institutions are included in series U 16 , unilateral transfers, even if they involve the purchase of fixed assets. For 1919-1970, series U 18 (short-term) includes changes in the U.S. Government short-term claims arising from holdings of foreign currencies (received as a counterpart to foreign grants or through sales of agricultural and other surplus products), deposits abroad, and various advances.
For 1919-1970, the shifts in capital claims in series U 19 and U 20 refer not only to securities (stocks, bonds, mortgages, etc.) but also to real property (farms, branch factories, and real estate). Series U 19 consists of net purchases of stocks in, and of changes in, net claims by U.S. parent companies against foreign incorporated companies in the management of which U.S. companies have an important voice, and net changes in the equity in foreign branches of U.S. companies. Series U 20, other private long-term capital movements, consists of U.S. purchases of newly issued foreign securities, amortizations of foreign bonds, net transactions in outstanding foreign securities, and net changes in long-term claims reported by U.S. banks (including loans made by private banks and guaranteed by the Export-Import Bank) and other commercial enterprises.
Series U 21 includes changes in bank deposits, brokerage and commercial balances, and uncollected bills.
For 1919-1970, the data for series U 22-23 represent changes in liabilities of the United States to residents of foreign countries, or changes in assets held in the United States by residents of foreign countries. Series U 22 represents shifts in foreign claims on the United States with an original maturity of more than one year, including changes in the investments of foreign corporations in their branches and subsidiaries in the United States, and transactions by foreigners in the U.S. public debt obligations. Series $U 23$ represents shifts in the liabilities of the U.S. Government and of private individuals and institutions with an original maturity of one year or less. Foreign short-term claims on the U.S. Government include deposits with the Treasury and other Government agencies and changes in foreign holdings of U.S. Government short-term obligations. Foreign short-term claims on private Americans include foreign deposits in U.S. banks, changes in holdings of privately issued short-term securities, and other commercial liabilities. The data also include an estimate of movements of U.S. currency and coins.

U 24, transactions in U.S. official reserve assets, net. This entry measures net changes in the official reserve assets of the United States, which consist of U.S. holdings of monetary gold, special drawing rights (SDR), convertible foreign currencies, and gold tranche position in the International Monetary Fund (IMF).

Monetary gold includes the U.S. gold stock held by the U.S. Treasury and the Exchange Stabilization Fund. (On December 9, 1974, Treasury acquired all gold held by the Exchange Stabilization Fund.) The transactions also included gold sold to the United States by the IMF with the right to repurchase, and gold deposited by the IMF to mitigate the impact on the U.S. gold stock of foreign purchases for gold subscription to the IMF under quota increases. Special drawing rights are international reserve assets created through amendments to the Articles of Agreement of the IMF to provide orderly and adequate growth in international liquidity. Thus far (1974) there have been three annual allocations to the United States and other participating nations made on January 1, of 1970, 1971, and 1972. U.S. holdings of special drawing rights in the Special

Drawing Account in the IMF include allocations and acquisitions, net of use. Convertible foreign currencies represent Treasury and Federal Reserve System holdings of convertible foreign currencies in U.S. dollar equivalents. The U.S. gold tranche position in the IMF represents the amount that the United States could purchase in foreign currencies automatically if needed; it is equivalent to the U.S. quota in the IMF minus the Fund's holdings of U.S. dollars.
$\mathbf{U} 25$, errors and omissions. As indicated above, this is the residual item which has been given the sign ( + or - ) necessary to make the statement balance. It compensates for missing data, possible errors in the estimates, as well as for seasonal and other leads and lags in the reporting of the debt and credit phases of transactions which are compensating over a period of time.

## U 26-39. International investment position of the United States, 1843-1970.

Source: 1843-1914, Cleona Lewis, America's Stake in International Investments, The Brookings Institution, Washington, D.C., 1938 (copyright). 1919-1945, U.S. Office of Business Economics, various publications. 1946-1970, U.S. Bureau of Economic Analysis (formerly Office of Business Economics), Balance of Payments Statistical Supplement, Revised Edition; and Survey of Current Business, August 1963 and 1964, September 1965 and 1966, and October 19681972.

The estimates for 1919-1945 are based on the following publications: (1) The United States in the World Economy, Office of Business Economics, Economic Series No. 23, Washington, D.C., 1943, p. 123; (2) The Balance of International Payments of the United States in 1931, Bureau of Foreign and Domestic Commerce, Trade Information Bulletin No. 803, Washington, D.C., 1932, pp. 44, 48, and 62; (3) Foreign Investments in the United States, Bureau of Foreign and Domestic Commerce, Washington, D.C., 1937, p. 5; (4) Cleona Lewis (see source above for 1843-1914) ; (5) International Transactions of the United States During the War 1940-45 (as revised), Office of Business Economics, Economic Series No. 65, 1948, p. 110.

In America's Stake in International Investments, direct investments are based on book value wherever possible; portfolio investments are calculated at par value for bonds and preferred stocks, and at market value for common stocks. Similar practices were followed in the estimates of the Department of Commerce for 1930, 1931, and 1935; miscellaneous portfolio investments for the same years were calculated at market values wherever possible. For 1940, 1945, and 1946-1970, the values of bonds and preferred stocks as well as of common stocks were calculated at market prices wherever possible.

The estimates for these series prior to 1919 were prepared by compilers who used different valuation methods and whose data varied in completeness. While the estimates are therefore not homogeneous, they do present rough indications of the magnitudes involved.

## U 40. Intermational investment position of the United States (net liabilities), 1789-1900.

Source: 1789-1860, Douglass C. North, "The United States Balance of Payments, 1789-1860," cited in text for series U 1-25; and 1861-1900, Matthew Simon, "The United States Balance of Payments, 1861-1900," also cited in text for series U 1-25. (Copyright.)

In the source studies, a net liability of $\$ 60$ million was estimated for 1789. For the following years, the changes were computed by adding the annual net international flow of capital which is the balancing item, series U 18-23, for exports and imports of goods, services, and unilateral transactions. For certain years, adjustments were made for defaults. Differences between the accumulating "net indebtedness" in the source studies and the data in series U 40 are due to adjustments incorporated in series U 1-25 as explained in the text for those series.

## U 41-46. Value of direct investment in foreign countries, by area and industry groups, 1929-1970.

Source: See source for series U 26-39.
See also general note for series U 1-74, and text for series U 18-23.
U 47-74. Value of foreign direct investment in the United States, by area and industry, 1937-1970.

Source: U.S. Office of Business Economics, 1937-1961, Foreign Business Investments in the United States, 1962; 1962-1970, Survey of Current Business, various issues (usually September or October).

The basic data for these series were derived from reports filed with the Department of Commerce by enterprises in the United States in which there was a foreign interest of 25 percent or more. Reports were required by law under section 8 of the Bretton Woods Agreements Act ( 59 Stat. 515, 22 U.S.C. $286 f$ ). Forms and instructions were mailed directly to lists of companies developed from tax records, news reports, previous census studies, and records of the Office of Business Economics.

In general, a report was required for every U.S. business enterprise, including real estate investments, in which a foreign person or organization owned 25 percent or more of the voting stock, and for similar interests in noncorporate enterprises. A report was required both when the 25 percent foreign interest was direct in a U.S. primary organization or was indirect in a subsidiary, called a secondary organization.

There were certain exemptions from filing a report, as follows: (a) If the value of total assets was less than $\$ 50,000$, a report was required only for information identifying the reporter; (b) reports were not required from religious bodies, charitable organizations, or other nonprofit organizations in the United States; (c) reports were not required in connection with real or personal property acquired for personal use or occupancy.
The coverage is believed to be quite complete for substantial industrial investments. However, there are probably many small trading organizations and holdings of real estate not covered. The extent of these investments is not believed to be significant.

It should be noted that this survey does not cover portfolio foreign holdings of U.S. corporate securities, or other miscellaneous investments here.

Direct foreign investments in the United States included the following U.S. business enterprises for which reports were required: (1) A U.S. corporation in which 25 percent or more of the voting stock was owned directly or indirectly by a foreign person or organization; (2) branches of foreign corporations resident in the United States; (3) partnerships and proprietorships resident in the United States in which 25 percent or more ownership was held by a foreign person or organization; (4) U.S. enterprises held as part of an estate or trust created under the laws of the United States in which foreign beneficial owners held an interest of 25 percent or more; (5) real estate and other real property, including leaseholds, acquired for commercial purposes, in which an interest of 25 percent or more was held by a foreign person or organization.

These series cover the 50 States, the District of Columbia, the Commonwealth of Puerto Rico, the Panama Canal Zone, and outlying areas of the United States.

Each reporter or foreign-owned U.S. company was classified by the country of the foreign parent organization. Secondary reporters or subsidiaries of the primary organization were given the same country classification as the primary.

The major areas for classification were Canada, United Kingdom, other Western Europe, Latin American Republics, Asia, Africa, and Australia. The investment was generally quite small for countries in Asia, Africa, or Latin America.

The Standard Industrial Classification (SIC) issued by the then Bureau of the Budget was the basic guide used for classifying reporters by industry. However, certain departures were made in
connection with grouping certain industries into major divisions. This change in grouping consisted, for the most part, in shifting certain industries to major divisions on the basis of their relationship or integration of operations. For example, reporters engaged in petroleum production and others engaged in petroleum refining were classified under petroleum as a major industrial division. The SIC had no such classification and production is included under mining (not shown separately here) and refining under manufacturing. Similarly, other integrated operations of oil companies were included under petroleum.

Frequently a reporter was engaged in more than one business activity, especially in those cases where the report furnished was a consolidation of several companies in different lines of business. Such a report was classified according to the basic activity involved.

Reporters who were primarily holding companies of U.S. operating companies were classified according to the industry of the operating companies.

U 75-186. U.S. Government foreign grants and credits, by country, 1945-1970.

Source: U.S. Bureau of Economic Analysis, unpublished summary of data published in more detail in "Foreign Aid by the United States Government, 1940-1951," a 1952 supplement to the Survey of Current Business, and in the periodic report, Foreign Grants and Credits by the United States Government.

The following text was excerpted from Annual Report of the Bretton Woods Agreement Act (Communication from the Chairman, National Advisory Council on International Monetary and Financial Policies), 93d Congress, 1st session, House Doc. No. 93-34, pp. 120-122.

These series were compiled by the Bureau of Economic Analysis from information made available by agencies operating the grant, credit, and other assistance programs, and include some estimates for transactions not yet recorded on the operating agencies' books. Items based on estimates have been adjusted or qualified on the basis of information received to the date of preparation of these series, but in some instances are subject to future adjustments.

The data on credits are comparable, with minor exceptions, to those appearing in Foreign Credits by the United States Government, a semiannual publication of the Department of the Treasury, in which a detailed enumeration of every active foreign credit of the U.S. Government, showing its current status, is presented.

The data are divided into three categories-grants, credits, and other assistance through net accumulation of foreign currency claims under programs for the sale of agricultural commodities. The Government's capital investments in, or contributions to, the international financial institutions constitute an additional measure taken by this Government to promote foreign economic recovery and development. Payments to these institutions do not result in immediate equivalent aid to foreign countries. Use of available dollar funds is largely determined by the managements of the institutions, in some instances subject to certain controls which can be exercised by the U.S. Government. Changes in the procedures for disbursing the U.S. Government contributions, initiated in 1965, have retarded such actual Government payments to agree more closely with the actual disbursement of assistance by the international institution to the foreign country.

Grants are transfers for which no payment is expected, or which at most involve an obligation on the part of the receiver to extend aid to the United States or other countries to achieve a common objective. Credits are loan disbursements or transfers under other agreements which give rise to specific obligations to repay, over a period of years, usually with interest. Other assistance represents the transfer of U.S. farm products in exchange for foreign currencies (plus-since the enactment of Public Law 87-128-principal and interest collections in foreign currencies for credits extended under the farm products sales program) less the Government's disbursements of the currencies as grants, credits, or for purchases. The net acquisition of currencies
represents net transfers of resources to foreign countries under the agricultural programs, in addition to those classified as grants or credits.

Occasionally, assistance has been given under indeterminate conditions, subject to future settlement. Indeterminate aid on this basis is included with grants, in the period rendered. When settlement for such indeterminate aid is agreed upon, the terms may call for a cash settlement or may establish a long-term credit. Cash settlements are included in returned grants. Amounts of the newly established credits are added to outstanding indebtedness.
The U.S. Government receives some returns on its gross grants and credits. The returns which are deducted from gross grants and credits to arrive at net grants and credits include (1) reverse lendlease; (2) the dollar value of the portion of grant counterpart funds paid to the United States for its use; (3) returned lend-lease and civilian supply ships; (4) returns of military equipment "Ioaned"; (5) cash received in war-account settlements for lend-lease and other aid; and (6) principal repaid on credits, but not interest. The Government's disbursements of currencies are deducted from the accumulation of currency claims in calculating net other assistance.

The measure of foreign grants and credits generally is in terms of (1) dollars disbursed by the U.S. Government to or for the account of a foreign government or other foreign entity or individual, and (2) dollar equivalents of goods delivered or shipped, services rendered, or foreign currencies disbursed to or for such foreign account. Correspondingly, returns are measured in terms of the dollars received by the U.S. Government, or the dollar equivalents of goods, services, and foreign currencies received. Dollar equivalents are, of necessity, frequently estimated.
Assistance is shown by country, or general area, where possible. In certain instances (particularly in the earlier postwar period), data for parent countries include those for their dependent area; for example, although goods have been shipped to a then dependent area, Tunisia, such aid was reported as rendered to the parent country, France.

Transactions shown for a country are not necessarily with the government of such country, but are often with individuals, relief organizations, international organizations, or other private entities located in the designated country and considered to be within its economy.

Series U 1-25. Balance of International Payments: 1790 to 1970
[In millions of dollars. For fiscal years, 1790-1900; thereafter, calendar years]

| Year | Exports of goods and services 1 |  |  |  |  |  |  | Imports of goods and services |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

2 Asian Development Bank, Inter-American Development Bank, International Bank for Reconstruction and Development, International Development Association, and International Finance Corporation.
${ }^{3}$ Net new grants not adjusted for settlements for postwar relief and other grants under agreements, and net new credits exclude prior grants converted into credits, Which were as follows: July 1945-December 1955, \$2,198 million; 1956-66, \$491 million. Repayments on these settlements included in net new credits.
${ }^{4}$ Developed countries include Australia, Canada, Japan, New Zealand, Republic of South Africa, and countries of Eastern and Western Europe except Spain, Yugoslavia, and Malta. Developing countries include all other countries.

- Outstanding credits on Dec. 31, 1970, totaled $\$ 27,568$ million representing net credits extended since organization of Export-Import Bank, Feb. 12, 1934, less chargeoffs, and net adjustments due to exchange rates ( $\$ 989$ milion), and excluding World
War I debts. The amount repayable in dollars at U.S. Government option was $\$ 20,131$ War I debts. The amount repayable in dollars at U.S. Government option was $\$ 20,131$ million; the remainder was repa
at the option of the borrowers. 6 Equivalent value of currencies still available to be used, including some funds advanced from foreign governments and after loss by exchange rate fluctuations ( $\$ 1,334$ billion), was $\$ 1,446$ billion on December $31,1970$.
${ }^{8}$ Separate data became available during 1954. For earlier periods, data shown as Indochina.

# Foreign Commerce (Series U 187-352) 

## U 187-352. General note.

Statistics on foreign trade of the United States are among the most useful, revealing, and, in spite of their deficiencies, reliable series relating to the growth of the American economy. This situation is especially true for the first 100 years of the Republic. The United States was more heavily dependent upon foreign markets and sources at that time than it has been in the 20th century. For a fuller discussion of the usefulness of such data, see G. G. Huebner's review of foreign trade of the United States in Emory Johnson, History of Domestic and Foreign Commerce of the United States, Carnegie Institution, Washington, D.C., 1915. This study has an excellent bibliography of material on foreign trade available at that time.

Since the first appearance of the Statistical Abstract of the United States in 1878, official time series on foreign trade have been presented in that publication and it is, therefore, cited here as a primary source for certain of the foreign trade data shown.

Foreign trade data are subject to a variety of special statistical problems relating to compilation, publication, coverage, valuation, and classification as to composition and direction. The record of gold movements, in particular, has been found to be subject to considerable error owing to its peculiar qualities which make it both a useful form of money and a likely candidate for smuggling (see R. G. D. Allen and J. Edward Ely, International Trade Statistics, John Wiley and Sons, New York, 1953; and Oskar Morgenstern, Validity of International Gold Movement Statistics, Special Paper in International Economics No. 2, International Finance Section, Princeton University Press, November 1955).

The first Congress of the United States provided for the compilation of statistics on foreign trade, and the Treasury Department, through its customhouses, began keeping a record of foreign trade beginning August 1, 1789. According to the Treasury Department, government records of the total values of our imports for 1790 to 1820 are fairly complete but do not show, except for a few years, the articles imported. They show, however, domestic exports by articles, but do not distinguish the values of merchandise from coin and bullion imported and exported, nor the value of the commerce with each country (see Statistical Tables Exhibiting the Commerce of the United States With European Countries From 1790-1890, Washington, D.C., 1893 , p. vii).

Compared with currently compiled statistics, these earliest records left a great deal to be desired. J. Edward Ely, writing on the historical development of foreign trade statistics, observes that:

The United States may be said to have had an adequate set of import and export statistics only since about 1821. Prior to that time no information was compiled on the amount of imports of articles which were free of duty upon importation into the United States. No value figures were compiled on imports subject to specific rates of duty and the dollar value for imports subject to ad valorem rates of duty, although apparently accurate, was compiled only as a total with no information on how much of each commodity was imported. Existing figures on the total dollar value of imports during the years 1795 to 1801 were apparently estimated at the time by the Secretary of the Treasury, and the figures for 1790-1794 and from 1802-1820 were apparently estimated many years later. (Allen and Ely, cited above, p. 269.)
Douglass North observes that the 1789-1820 figures were "officially overhauled and published in the Report of the Secretary of the Treasury on Finances for 1885" (see North's "United States

Balance of Payments, 1790-1860," Studies in Income and Wealh, vol. 24, National Bureau of Economic Research, 1960). In employing the early records, North found a number of deficiencies, and users of figures for 1790-1820 should note his revised figures and consider the criticisms in the appendix to his paper. The adequacy of the early records, of course, depends upon the use made of them. Some of the earliest records were not published officially and scholars have had to depend on information from $A$ View of the United States of America, published by Tench Coxe in 1794, giving official documents for 1790 , 1791, and 1792; A Statistical Manual for the United States of America, by Samuel Blodget, Jr.; A. Statistical View of Commerce of the United States of America, by Timothy Pitkin, New Haven, 1835 (reprinted by Johnson Reprint Corporation in 1967), presenting many tables obtained directly from the Treasury books; and Statistical Annals by Dr. Adam Seybert, covering the period 1789-1818, and giving statistics of population, commerce, public land, etc. Such data as were published annually for 1790-1820 were brought together later in U.S. Congress, American State Papers, Class 4, "Commerce and Navigation," two volumes, Gales and Seaton, Washington, D.C., 1832 (vol. I) and 1834 (vol. II).

In 1820, Congress passed a law to provide for obtaining accurate statements of the foreign commerce of the United States and, at the same time, established the Division of Commerce and Navigation in the office of the Register of the Treasury. It required collectors of customs to compile and transmit annual reports to that office showing the detailed trade with foreign countries and the navigation employed therein. Beginning with 1821 , these reports were consolidated and published annually in Commerce and Navigation of the United States.

Foreign trade statisties published by the Federal Government after 1820 are regarded as superior to those for the earlier period but still subject to some deficiencies, notably with respect to valuation of imports. They also suffered in respect to coverage of overland exports (see North, cited above, app. II, and Allen and Ely, cited above, pp. 270-271).
The Civil War introduced two special difficulties. For the last three quarters of fiscal year ending June 30, 1861, certain ports of the Southern States failed to make reports, and it was necessary for the Treasury Department to introduce estimates of the exports of cotton by the Southern States during the war based on records of the main recipient countries in Europe (see Treasury Department, Statistics of the Foreign and Domestic Commerce of the United States, Washington, D.C., 1864, p. 39).

The second difficulty was introduced in 1862 when the United States abandoned the specie backing for its money. The dollar fluctuated against foreign currencies and gold with each reverse or success of the northern forces. While imports and reexports continued to be valued in specie (dollars of a fixed parity to gold), since these goods were initially expressed in foreign currencies, domestic exports were recorded in "mixed values"-partly gold dollars and partly dollars of a fluctuating value-from 1862 until the resumption of specie payment in 1879. These deficiencies were recognized at the time both officially by the Director of the Bureau of Statistics (established in the Treasury Department in 1866) and by private observers (see, for example, Louis Blodgett's criticism and evaluation of U.S. foreign trade statistics in the early 1860's in The Commercial and Financial Strength of the United States as Shown in the Balances of Foreign Trade and the Increased Production of Staple Articles, King and Baird, Philadelphia, 1864). Treasury statisticians sought to adjust mixed currency values to specie values of total imports and
exports and some other broad aggregates. The adjustments, however, were not carried through completely to country and commodity detail, and only a limited number of domestic export series are available for 1862-1879 in terms of "specie values" while the domestic export figures for countries and individual commodities are only available in mixed currency values.

When Congress established the Bureau of Statistics in 1866, it also specified that the kinds, quantities, and values of all articles exported and imported should be distinctly set forth in the statistical accounts, by countries of destination or of shipment, and that the exports of articles produced or manufactured in the United States should be shown separately from the reexports of foreign articles imported into the United States. Prior to 1866, only annual statistics of the foreign commerce of the United States were published; since then, monthly statistics have also been published.

The first report of the Director of the Bureau of Statistics in 1867 contains several pointed criticisms of the previous statistics, and the subsequent annual reports of Foreign Commerce and Navigation emphasized the shortcomings of the figures presented, especially the difficulty which became important in the post-Civil War period of reporting on trade with Canada in the absence of any mandatory reporting requirement on the railroads (see, for example, the Annual Report of the Chief of the Bureau of Statistics on the Commerce and Navigation of the United States for the Fiscal Year Ended June s0, 1877, 1878, pp. xii-xiii, table showing ". . . the imports into Ontario, Quebec, and Manitoba, from the United States in excess of the domestic exports from the United States to Canada, as returned to the Bureau of Statistics by U.S. collectors of customs during the fiscal year ended June 30, 1877.'). An act of March 3, 1893, provided for obtaining information on exports by rail and apparently eliminated this deficiency in the subsequent figures, but prior to that time trade totals and figures on trade with Canada suffer lack of coverage in varying degrees.
For additional comments on foreign trade data for 1861-1900, see Matthew Simon, "Statistical Estimates of the Balance of International Payments and the International Capital Movements of the United States, 1861-1900," Studies in Income and Wealth, vol. 24, National Bureau of Economic Research, 1960.
In 1923, the function of compiling foreign trade statistics was transferred to the Department of Commerce; however, the release and publication of the annual figures had been done by that Department since 1903. In 1941, the function was transferred from the Bureau of Foreign and Domestic Commerce to the Bureau of the Census.
A problem affecting comparability of value statistics arose between January 31, 1934, and March 10, 1953, when the foreign exchange value of the dollar was permitted to depreciate as a result of the restriction placed on gold shipments to foreign countries. For this period, unless otherwise noted, values stated are in U.S. dollars without reference to changes in the gold content of the dollar.
World War II and the special foreign aid programs following it introduced new complications into the handling of U.S. foreign trade statistics. Lend-lease during the war, surplus property disposal immediately after the war, War Department shipments to relieve disease and unrest, economic and military aid, and security shipments have all complicated the presentation as will be noted below.
Import data compiled by the Department of Commerce are from import entries (various Customs forms) which importers are required to file with customs officials for each shipment arriving. Import values are, in general, based on market or selling price and are f.o.b. the exporting country. Values do not include import duties. The country of origin is defined as the country in which the merchandise was grown, mined, or manufactured. If the importer cannot obtain the information as to the country of origin, the merchandise is credited (for statistical purposes) to the country of shipment.
Imports are classified either as general imports or imports for
consumption. General imports represent total arrivals of imported goods (except for intransit shipments), that is, merchandise released from Customs custody immediately upon arrival plus merchandise entered into a customs-bonded storage, manufacturing, or refining warehouse immediately upon arrival. Imports for consumption comprise merchandise entered into the U.S. consumption channels, that is, merchandise released from Customs custody immediately upon arrival, merchandise entered into a customs-bonded manufacturing warehouse (other than smelting or refining warehouse), merchandise withdrawn from a customs-bonded storage warehouse for release into domestic consumption channels, and imported ores and crude metals which have been processed in a customs-bonded smelting warehouse and then withdrawn for consumption and export.

During past periods, data for some low-valued imports have been fully compiled while data for others have been estimated. The following changes have occurred in the methods of compiling data on low-valued imports: Effective January 1954-1957, imports valued at $\$ 250$ or less, reported on formal consumption and informal entries, were estimated from a 5 -percent sample. From January 1958-June 1965, formal entries valued under $\$ 100$ and informal entries valued $\$ 250$ or less, were estimated from a 1 -percent sample. Effective July 1965, all formal and informal entries valued $\$ 250$ and under have been estimated from a 1 -percent sample except a 5 -percent sample, in effect every 3 years, was used to estimate data for 1967 and 1970. The estimated import values are excluded from detailed commodity statistics but are included in the over-all totals and are distributed in the appropriate country, district, and economic class totals, and in the totals for groupings of commodity classifications (i.e., commodity group or subgroup). The total value so excluded generally amounts to about 1 percent of the annual import total. Some indication of the undercounting in the detailed commodity statistics for imports is presented in the appendixes to the annual issues, from 1954-1965, of Bureau of the Census, Report FT 110, United States Imports of Merchandise for Consumption, and beginning 1967, Bureau of the Census, Report FT 135, Imports, Commodity by Country. Explanations of the sampling procedures are given in Report FT 110 for 1956; monthly issues of Report FT 135, Foreign Commerce and Navigation of the United States, 1965; and annual issues of Guide to Foreign Trade Statistics.

Export data are from Shippers' Export Declarations which exporters are required to file with customs officials for each shipment leaving the United States. Export data include shipments made after World War II under the Department of the Army Civilian Supply Program only for 1948 and subsequent years. In addition, export data include United States exports under the Lend-Lease, United Nations Relief and Rehabilitation Administration, Economic Cooperation Administration, Mutual Defense Assistance, and other mutual security programs. Shipments to U.S. Armed Forces for their own use are not included in export statistics for any period.
Export value figures are based on the selling price (or on the cost, if not sold) of the commodity shipped and include inland freight, insurance, and other charges to the U.S. place of export. Transportation and other costs beyond the United States port of exportation are excluded. The country of destination is defined as the country of ultimate destination or country where the merchandise is to be consumed, further processed, or manufactured. In the event the exporter does not have definite information as to the country of ultimate destination for a shipment, it is credited (for statistical purposes) to the country to which it is consigned.

Certain export commodity classifications were grouped for security reasons into special categories beginning with May 1949, with periodic amendments to include additional commodities. With the adoption of new security regulations, effective July 1950, the publication of the country of destination and customs district detail for the special category commodities and groups was discontinued. Effective January 1965, some changes were made in the security restrictions primarily because of revisions in export commodity classifications. Permission was granted to release data on exports of some commodities
which were previously classified as special category commodities with the result that security restrictions were applied to considerably fewer commodities than before. In addition, permission was granted to release some commodity data for 1964 and prior years, which was withheld when statistics for those years were initially released. Data for special category commodities are included, however, in all total export statistics, series U 187, U 190, U 191, U 213, U 225, U 226 , and U 317; in the eategory of finished manufactures, series U 218 , U 235 , and U 236 ; and in the commodity categories of series U 274-294 (except automobiles and parts, series U 287, from which machinery and vehicles manufactured to military specifications have been excluded beginning in July 1949).

Shipments individually valued, prior to October 1969, at less than $\$ 100$ and, thereafter, at $\$ 250$ and under, are not classified by commodity, but are reported in a single separate category. Effective with the statistics for July 1953 and continuing through December 1955, data for export shipments individually valued from $\$ 100$ to $\$ 499$ (about 4 to 6 percent of the total export value) were estimated on the basis of a 10 -percent sample. From January through June 1956, the 10 -percent sample was applied to shipments individually valued from $\$ 100$ to $\$ 999$ but, subsequently, the level was reduced to the previous level of $\$ 499$. From July 1956-December 1959, shipments valued $\$ 100-\$ 499$ were based on a 10 -percent sample; from January 1960 -December 1962, on a 10 -percent sample for Canada and a 50 -percent sample for other countries. From January 1963-September 1969, shipments to Canada valued $\$ 100-\$ 1,999$ were based on a 10 -percent sample; shipments to other countries valued $\$ 100-\$ 499$ were based on a 50 -percent sample. From October 1969-December 1969, shipments to Canada valued $\$ 251-\$ 1,999$ were based on a 10 -percent sample; shipments to other countries valued $\$ 251$ - $\$ 499$, on a 50 -percent sample; from January 1970-August 1970, shipments to other countries valued $\$ 251-\$ 499$ were fully compiled. For Canadian shipments valued $\$ 251-\$ 1,999$, sampling procedures were applied. Effective September 1970, shipments to Canada valued $\$ 251-\$ 1,999$ were based on a 10 -percent sample; shipments to other countries valued $\$ 251-\$ 499$ on a 50 -percent sample. Value data for shipments less than $\$ 100$, prior to October 1969, and less than $\$ 251$ thereafter, were estimated each month from factors established by observation of the percentage relationship of the under-\$251 (under $\$ 100$ prior to October 1969) shipments to the individual country totals in past periods. Details concerning sampling error and procedures are given in the Bureau of the Census, Quarterly Summary of Foreign Commerce of the United States, January-December 1956; Foreign Commerce and Navigation of the United States, 1965; monthly issues of Report FT 410, Exports, Schedule B Commodity by Country; and annual issues of Guide to Foreign Trade Statistics.

The geographic area covered by these statistics, except as noted, is the United States customs area, which includes Alaska, Hawaii, and Puerto Rico, and for 1935-1939, the Virgin Islands.

## U 190-196. Merchandise exports and imports, 1790-1970.

Source: Series U 190-192 and U 196, U.S. Bureau of Foreign and Domestic Commerce, 1790, Foreign Commerce and Navigation of the

United States, 1912, p. 43. U.S. Department of the Treasury, Bureau of Statistics, 1791-1880, Monthly Summary of Imports and Exports of the United States for the Fiscal Year, 1896, pp. 622-623 (except 1821, series U 190, U 192, and U 196, revised estimates prepared by Bureau of the Census). U.S. Bureau of the Census, Statistical Abstract of the United States, 1924 edition, pp. 420, 421, and 424; 1904-1941, 1948 edition, pp. 902-903; 1942-1946, Summary of Foreign Commerce of the United States, various annual issues; 1947-1965, Foreign Commerce and Navigation of the United States, 1964 and 1965; 1966-1970, Highlights of Exports and Imports, FT 990, December 1972, pp. 37 and 79. Series U 193-195, U.S. Bureau of Foreign and Domestic Commerce, 1821-1880, Foreign Commerce and Navigation of the United States, 1912, p. 50; 1881-1915, Foreign Commerce and Navigation of the United States, 1924, p. lxvii. U.S. Bureau of the Census, 1916-1941, Statistical Abstract of the United States, 1948 edition, p. 939; 1942-1946, 1951 edition, p. 854; 1947-1965, Foreign Commerce and Navigation of the United States, 1964 and 1965; 1966-1970, Statistical Abstract, 1972 edition, p. 788.
Merchandise export statistics include data on all shipments of commodities and merchandise leaving the United States customs area except: (1) Gold and silver (prior to 1968) and evidences of debt; (2) intransit merchandise; (3) bunker fuel, stores, supplies, and equipment for vessels and planes; (4) temporary exports; (5) merchandise having small value or no commercial value; (6) shipments of military and naval supplies and equipment to the U.S. Armed Forces; and (7) shipments of office equipment and related items to U.S. Government agencies or establishments.
Exports of U.S. merchandise, series U 191, consist of commodities grown, produced, or manufactured in the United States, and commodities of foreign origin which have been changed in the United States from the form in which they were imported, or which have been enhanced in value by further manufacture in the United States.
Reexports, series U 192, comprise withdrawals from customsbonded storage warehouses for exportation and exports of foreign merchandise (principally duty-free articles) which have previously been formally entered through customs. Exports of foreign merchandise consist of commodities of foreign origin which have entered the United States as imports and which, at the time of exportation, are in the same condition as when imported.
Merchandise import statistics include data on all commodities and merchandise reaching the United States except: (1) Merchandise not entering the U.S. customs area, such as articles excluded from the United States by law; (2) bunker fuel, and ships' stores; (3) intransit merchandise; (4) certain domestic merchandise returned from foreign countries; (5) gold and silver (prior to 1968) and evidences of debt; (6) merchandise having small value or no commercial value; and (7) commodities entered under special provisions, such as articles consigned to diplomatic officers. General imports, series U 193, consist of entries for immediate consumption and entries into bonded warehouses, and therefore comprise the total arrivals of merchandise, whether they enter consumption channels immediately or are entered into warehouses under customs custody to be subsequently withdrawn for consumption or withdrawn for exportation. Imports for consumption are the total of the entries for immediate consumption and the withdrawals from warehouse for consumption. The terms "entered for immediate consumption" and "withdrawn from warehouse for consumption" are taken from the language used in handling the transactions through customs, and are sometimes misleading in their implication that the merchandise is immediately assimilated by being processed, merchandised, or consumed. Although all customs barriers to such assimilation have been removed, merchandise for "immediate consumption" may, in fact, be warehoused by the importer outside of customs custody. In the case of withdrawal for "consumption," although duties have been paid and the goods released from customs control, they may remain in storage for a further period of time. Any of this "for consumption" merchandise could conceivably be exported subsequent to its release from customs custody and thus never enter actual U.S. consumption channels.

U 197-200. Gold and silver exports and imports, 1821-1970.
Source: U.S. Bureau of Foreign and Domestic Commerce, 18211864, Foreign Commerce and Navigation of the United States, 1912, p. 43. U.S. Department of the Treasury, 1865-1880, Statistical Abstract, 1887, pp. 41, 42. U.S. Bureau of the Census, 1881-1941, see source for series U 187-189 above; 1942-1946, Summary of Foreign Commerce of the United States, various annual issues; 1947-1965, Foreign Commerce and Navigation of the United States, 1964 and 1965; 1966-1970, U.S. Foreign Trade, Gold Movements, FT 2402, December issues.

Prior to 1895 , figures for gold and silver relate to coin and bullion only; subsequently, they include ore also. Domestic exports of gold and silver cannot be separately stated prior to 1864, but it is probable that the greater portion of the exports was gold. In the series shown here, the data on exports of gold prior to 1864 include domestic exports of silver. The exports of silver for years prior to 1864, therefore, consist of only foreign exports or reexports.

## U 201-206. Foreign trade related to various measures of production, 1869-1970.

Source: Series U 201-202, 1869-1939, computed as the ratios respectively of series U 190 and U 193 to gross national product (using series $F 1$ for all years except 1909-1918; for these years, the estimates of gross national product are from U.S. Senate, 79th Congress, 1st session, "Report to the Committee on Banking and Currency," Basic Facts on Employment and Production, Senate Committee Print No. 4); 1940-1957, U.S. Bureau of Foreign Commerce, Exports in Relation to United States Production, 1957, p. 2; 1958-1962, U.S. Bureau of International Commerce, Exports in Relation to U.S. Production, 1962, Overseas Business Reports No. 63-118, p. 2; 1963-1970, ratios computed from foreign trade data, as published by BIC in U.S. Foreign Trade Annual, 1966-1972, Overseas Business Reports No. 73-12, p. 2, and gross national product data as published by U.S. Bureau of Economic Analysis in Survey of Current Business, July 1973, p. 52. Series U 203-204, 1919-1927, 1931, and 1935, U.S. Bureau of Foreign Commerce, World Trade Information Service Statistical Reports, part 3, No. 58-22; 1929, 1933, and 1937-1962, see source for series U 201-202, 1940-1957 and 1958-1962; 1963-1970, value of production corresponds to aggregate for agricultural production (U.S. Department of Agriculture, Farm Income Situation, No. 222, July 1973, table 29, and U.S. Bureau of Economic Analysis, Survey of Current Business, July 1973, p. 24), manufacturing (U.S. Bureau of the Census, Annual Survey of Manufactures, 1971, No. M71 (AS), p. 3), mineral production (U.S. Department of the Interior, Statistical Summary-Minerals Yearbook, 1972), and freight receipts (U.S. Interstate Commerce Commission, Annual Report on Transport Statistics of the United States). Series U 206, Don D. Humphrey, American Imports, (C) 1955 by the Twentieth Century Fund, New York, pp. 527-528.
For additional data on the relation of foreign trade to the domestic economy, see the following: Bureau of International Commerce, Overseas Business Reports: Contribution of Imports to United States Raw Material Supplies, No. 63-8; and Contribution of Imports to U.S. Food Supplies, No. 63-51. Also see Bureau of the Census, U.S. Commodity Exports and Imports as Related to Output, 1970 and 1969.

U 207-212. Value of merchandise imports and duties, 1821-1970.
Source: See source for series U 193-195.
Imports are "imports for consumption" consisting of entries for
immediate consumption and withdrawals from warehouses for consumption. The term "entry for consumption" is the technical name of the import entry made at the customhouse, and implies that the goods have been delivered into the custody of the importer and that the duties have been paid on the dutiable portion. Some of them may be exported afterwards.

For 1821-1866, the figures for import values, series U 207-209, represent net general imports (total imports less reexports), the amount of duty collected (calculated) being the annual amounts collected on merchandise only. For 1867-1970, the figures of import values represent imports entered for consumption.

U 210, duties calculated. The series described here as "duties calculated" is the series identified in annual volumes of Foreign Commerce and Navigation . . ., through the 1925 issue, as "duties collected"; subsequent issues describe it as "duties calculated." In spite of its description, it was a computed figure at least back to 1876. The evidence indicates that the earlier years, at least in part, were on a "duties collected" basis. This series should not be confused with the modern series called "duties collected" (not shown here) which represents the total amount of duties actually collected (on individual shipments) as reported to the Treasury Department by customs officials, subject in certain cases to subsequent refund as well as drawback. In contrast, "duties calculated" is a statistical measure derived by applying the appropriate rates to totals for all imports of the given commodity received at all ports of entry; it does not reflect drawbacks or refunds and is subject to some time lag in reporting.

U 211-212, ratio of duties to total. The calculated ratio of duties to total is simply the relationship of series U 210 to series U 207 and series U 209, respectively, expressed in percentage form. Series U 211-212 are similar to, but not identical with, the series described as "ratios of duties to total" shown in annual issues of Foreign Commerce and Navigation. . ., 1925 to 1946, and as "average ad valorem rates" in earlier issues. These series have been computed as shown here because of conflicts in source volumes with respect to early years.

U 213-224. Value of merchandise exports and imports, by economic class, 1820-1970.
Source: U.S. Bureau of the Census. 1820-1918, Statistical Abstract of the United States, 1820-1881, 1907 edition, pp. 698-701; 1882-1903, 1926 edition, pp. 448, 449; 1904-1918, 1947 edition, pp. 896, 897. 1919-1970, Indexes of U.S. Exports and Imports by Economic Class: 1919 to 1971, tables 1 and 5.

For definition of terms, see text for series U 190-196, U 207-212, and U 225-248.

The economic classes shown here are broad categories based on groupings of more than 2,000 individual commodities listed in Schedule B: Statistical Classification of Domestic and Foreign Commodities Exported From the United States, issued and kept current by the Bureau of the Census. Following are some of the important and typical commodities included in each of the economic classes:

| Class | Exports | Imports |
| :---: | :---: | :---: |
| Crude materials. | Crude petroleum | Crude rubber |
|  | Coal | Raw silk |
|  | Raw cotton | Hides and skins |
| Crude foodstuffs | Grains | Coffee |
|  | Fruits | Tea |
|  | Vegetables | Fruits |
| Manufactured foodstuffs_ | Meat | Sugar |
|  | Prepared fruits | Wheat flour |
| Semimanufactures.. | -Iron and steel plates | Wood pulp |
|  | Lumber | Copper in bars, etc. |
|  | Refined copper | Tin in bars, etc. |
| Finished manufactures. | Aircraft | Wool manufactures |
|  | Cigarettes | Newsprint Automobiles and parts |
|  | Radios and television sets | Automobiles and parts |

In a report on Exports of Manufactures From the United States and Their Distribution by Articles and Countries, 1800-1906 (1907), the Department of Commerce and Labor presented trade figures by economic classes annually back to 1850 and for selected years back to
1820. This study provided a different grouping of commodities than the Bureau of Statistics of the Treasury Department had previously employed for exports. In "Exports of Domestic Manufactures and Their Distribution' (Monthly Summary of Commerce and Finance of the United States, April 1903, p. 3239 ff.) the Treasury tabulated domestic exports for 1800-1850 by decade years and for 1851-1902 annually according to economic sector ("sources of production") as follows (p. 3249): Agriculture, manufactures, mining, forest, fisheries, and miscellaneous. But it tabulated imports "according to degree of manufacture and uses" for 1821, 1830, 1840, 1850, and 1851-1902 as follows (p. 3279-3280): Food and live animals, crude articles for domestic industries, articles manufactured wholly or partially for use as material in the mechanic arts, articles manufactured ready for consumption, and articles of voluntary use, luxuries, etc. This report noted that values for exports were in fluctuating currency for 1862-1879 and for those years gave specie values both for total exports and for exports of manufactures (p. 3315).

Trade in agricultural and forest products have been of special concern to the Department of Agriculture. Bulletin No. 51 of the Bureau of Statistics of the Department of Agriculture (1909) provides the "only compilation... ever to be completed (to that time)" of the "Foreign Trade of the United States in Forest Products, 1851-1908." Bulletins No. 74 and 75 in the same series, published in 1910, reviewed the "Imports of Farm Products Into the United States, 18511908" and "Exports of Farm Products From the United States, 1851-1908," respectively.

U 225-248. Indexes of quantity and unit value of exports and imports, by economic class, 1879-1970.
Source: 1879-1921 (1913 =100 base), Robert E. Lipsey, Price and Quantity Trends in the Foreign Trade of the United States, Princeton University Press for the National Bureau of Economic Research, 1963 (copyright); U.S. Bureau of International Commerce, 1913 (1967 = 100 base), unpublished data; 1919-1970 (1967 = 100 base), Indexes of U.S. Exports and Imports by Economic Class: 1919-1971.

The Bureau of International Commerce indexes are computed by the Fisher formula, chained annually so that weights are taken from the given and preceding years. Commodities not directly entering into the calculations are taken into account in the weighting within the economic classes on the basis of certain assumptions regarding similarity of their price movements to price changes of commodities specifically covered.
The National Bureau of Eronomic Research indexes for the years 1879-1921 also used the Fisher formula linked from four time segments, within each of which weights are taken from the given year and the latest year of the segment. The National Bureau supplemented the U.S. foreign trade data with price information from other sources.
Descriptions of methods used for the two sets of indexes are available in the sources.
All commodities in U.S. export and import trade have been grouped into one of five economic classes as follows: (1) Crude foodsproducts for edible use (by man or animals) which have not been substantially processed after sale by the farmer, fisherman, rancher, or other primary producer; (2) manufactured foods-processed forms of crude foods, edible and refined oils, and oilcake and meal; (3) crude materials-products of farms, forests, fisheries, and mines which are for nonfood use and which are unprocessed by manufacturing; (4) semimanufactures-manufactured materials in the early stages of processing; and (5) finished manufactures-highly processed bulk materials and products manufactured from semimanufactures or other finished products.

## U 249-263. Value of exports and imports, by broad end-use class, 1923-1970.

Source: 1923-1967 (excluding World War II years), U.S. Office of Business Economics, U.S. Exports and Imports Classified by OBE

End-Use Commodity Categories, 1923-1968, tables 1 and 2; 1968-1970, U.S. Bureau of Economic Analysis (formerly Office of Business Economics), Survey of Current Business, March issues.
The Bureau of Economic Analysis (BEA), (formerly Office of Business Economics (OBE)) end-use series presented in series U 249263 are constructed from basic data provided by the Bureau of the Census, which has primary responsibility for compiling the official statistics of U.S. merchandise exports and imports. The Census Bureau currently collects foreign trade data on the basis of some 14,000 individual commodity numbers which are contained in its commodity classification schedules: almost 4,000 in Schedule B, for exports; over 10,000 in the Tariff Schedules of the United States Annotated (TSUSA), for imports.
BEA's-OBE's end-use categories are constructed by assigning each of these 14,000 basic "building blocks" to one of 228 basic enduse commodity groupings-116 for exports and 112 for imports-each of which is identified by a 4 -digit code number. These 4 -digit commodity groupings aggregate into broader intermediate groupings, identified by 3 -digit and 2 -digit codes. The intermediate groupings, in turn, combine at the broadest level into the principal 1-digit end-use categories- 7 for exports, 6 for imports, as shown in series $\mathbb{U}$ 249-263.

BEA's-OBE's classification scheme was designed to fill a gap in the presentation of foreign trade statistics by regrouping commodity exports and imports as compiled by the Bureau of the Census into new, broad commodity categories based on a concept of end-use demand. The data have customarily been classified in terms of the physical nature of commodities and their stage of processing, or in terms of the principal industries producing the commodities. The end-use classification is associated with the principal sectors of the economy using or consuming the commodities.

It should be noted that inasmuch as the BEA-OBE end-use categories are constructed from the Census Bureau's Schedule B (export) and TSUSA (import) classifications, the validity of the assignments of individual commodities to end-use categories is subject to the limitations of the census classifications systems. The 14,000 basic "individual" commodities classified in Schedule B and TSUSA very frequently represent not a single commodity but rather a number of different items not separately classified. These items are related by their material content or general function, but not necessarily by their end-use. This is especially true of "basket" classifications. For example, "rubber products, n.e.s." may include erasers and soap dishes for consumer use, as well as rubber flanges, rings, and valves for industrial use. In cases of this kind, the products deemed to comprise most of the value of the "basket" commodity-based on advice of foreign trade commodity specialists-determine the enduse assignment it will receive. In another case, the commodity "ball bearings" is a machinery part that has been assigned to the export end-use category "Capital goods, except automotive" even though it includes ball bearings for autos and trucks which would be assigned, if they were separately identifiable, to the end-use category "Automotive vehicles, parts, and engines."

U 250 and U 258, foods, feeds, and beverages. This category is comprised of food for human consumption and animal feeds, and includes edible animals. It excludes work animals and animals for breeding, which are included in "Materials associated with nondurable goods and farm output," a grouping within the industrial supplies and materials category. Tobacco is not included in the foods category: cigarettes, etc., are in the consumer goods (nonfood) category, while unmanufactured tobacco is considered to be an industrial material (used in the manufacture of cigarettes and other tobacco products). A distinction is made in the foods category between agricultural and nonagricultural commodities in exports, but not in imports. This category, unlike the other principal end-use categories, does not distinguish between manufactured and unmanufactured commodity classes in either exports or imports.

U 251 and U 259, industrial supplies and materials. This category encompasses crude and processed materials and supplies primarily associated with, or used in, the producing sectors of the economy-
manufacturing, farming, and construction. Both the export and import sides are set up so as to separate manufactured from unmanufactured goods. Agricultural and nonagricultural aggregates can be obtained for exports but not for imports.

The industrial supplies and materials end-use category is subdivided on the import side into five major intermediate groupings as follows: (1) Fuels and lubricants; (2) paper and paper base stocks; (3) materials associated with nondurable goods and farm output; (4) selected building materials, except metals; (5) materials associated with durable goods output. These aggregates were established in order to facilitate analysis of the relationships between domestic economic conditions and imports of industrial supplies and materials. For example, shifts in imports of materials associated with durable goods output can be examined for their relationship to changes in the Federal Reserve Board's production index of durable manufactures, and imports of selected building materials can be related to domestic construction and housing indicators.

On the export side, the industrial supplies and materials category is broken down between agricultural and nonagricultural goods; intermediate groupings similar to (3), (4), and (5), listed above, are not constructed.
(1) Fuels and lubricants-comprised of coal, oil, and gas. This grouping excludes petrochemicals, which are included with chemicals in another grouping within the industrial supplies and materials category. Although fuels and lubricants are partly associated with consumer goods as well as industrial supplies, it was not considered feasible to try to distinguish between fuel for home heating, for example, and fuel for industrial heating and energy.

Fuels and lubricants have been established as an independent major subcomponent of the industrial supplies and materials category on both the export and import sides because of their magnitude in our international trade, and because of the difficulty of associating them with the output of nondurable as distinguished from durable goods.
(2) Paper and paper base stocks-consists of pulpwood, woodpulp, and scrap materials for making paper; also paper products, mainly newsprint, but including also kraft paper, paperboard, and similar products. Excluded are such paper products as stationery, which are allocated to the consumer goods end-use category. The predominance of newsprint imports in the paper grouping, and the unique nature of this product, led to the establishment of paper, like the fuels and lubricants grouping, as a separate major subcomponent of industrial supplies and materials for both exports and imports.
(3) Materials associated with nondurable goods and farm out-put-consists of supplies and materials related to the manufacture of products considered to be nondurables. It includes such goods as crude and processed textiles, but not those manufactured into final products such as apparel and house-furnishings. The latter are in the consumer goods category. Also included are unmanufactured tobacco, chemicals (except medicinals), hides and skins, undressed furs, soap and perfumery ingredients, etc. Seeds, fertilizers, farm work animals and breeding animals, and eggs for hatching are included as materials associated with farm output. This grouping is constructed only for imports.
(4) Selected building materials, except metals-consists of such major (nonmetal) building materials as lumber, plywood and veneers, stone, sand, cement, lime, glass (except automotive), asbestos, gypsum, millwork, molding, prefabricated structures, etc. Excludes metals used in building (steel beams, copper tubing, wire, pipe, latches and locks, etc.). This grouping is constructed only for imports.
(5) Materials associated with durable goods output-consists of supplies and materials related to the manufacture of products defined to be durables. Includes primary metals and metal shapes, and fabricated metal manufactures for further assembly or incorporation in other goods (door hinges, latches, locks, and parts
and components not included elsewhere). This grouping is constructed only for imports.
It should be noted that the allocation of individual commodities to the various subcomponents outlined above is based on end-use demand and not on the nature of the commodities from a production (supply) viewpoint. To illustrate-imports of primary rubber, a "nondurable" commodity, is classified under "Materials associated with durable goods output" because its major end-use-as a tiremaking material-is associated with the production of such durable goods as motor vehicles (including tractors), and aircraft.

U 252 and U 260, capital goods, except automotive. This end-use category is designed to include all (nonmilitary) machinery, equipment, apparatus, and instruments-and their parts, components, accessories, and attachments. These products are associated with investment outlays for industrial and agricultural plant and equipment; for commercial, scientific, professional, and service-industry capital goods; and for natural resource development (petroleum and mining), and construction. Also included is transport equipment such as civilian aircraft and parts, railway rolling stock, and, for exports only, commercial cargo and passenger-carrying vessels. Automotive products are excluded from the capital goods end-use category as are other transportation items classifiable as consumer goods (yachts and other pleasure craft, motorcycles, etc.).

U 253 and U 261, automotive vehicles, parts, and engines. This category contains commodities that might have qualified for assignment to two other end-use categories; passenger cars and parts to consumer goods (nonfood), and trucks and buses and parts to capital goods. However, because it has not been possible to distinguish parts for passenger cars from parts for trucks and buses, and because of the overall magnitude and importance of U.S. automotive trade, a separate automotive category was established. There are groupings within the category for passenger cars, trucks and buses, and automotive parts and engines (including engine parts).
U 254 and U 262, consumer goods (nonfood), except automotive. Designed to cover products used by the final consumer, this category has been subdivided into durables and nondurables, as well as manufactured and unmanufactured. The overall category encompasses a broad variety of products including consumer-type transportation equipment other than automotive-pleasure craft, motorcycles, etc.-and furniture, rugs, appliances, radios and TV, clocks and watches, precious stones, and other durables; and apparel and household softgoods, leather, rubber and plastic articles, notions and toiletries, medicinal preparations, and other nondurables. In general, consumer goods have been classified as durables or nondurables on the basis of whether they are, respectively, hardgoods or softgoods. Rugs are an exception, being classified as durable goods because of their long life and relatively high cost, and because they can be characterized as consumer "capital goods" along with furniture and appliances. The consumer goods category consists predominantly of manufactured products, but also includes such unmanufactured items as gem stones, Christmas trees, nursery stock, and pet birds.

U 255, special category, domestic (military-type goods). This is an export category only. It includes military aircraft, engines, turbines, missiles and rockets, military trucks, warships, ordnance, and other military material classified confidential by the Department of Defense as to country of destination. (Prior to 1965, DOD classified many military items confidential as to their identity as well as their destination.) A few other military items currently of minor value, not classified as special category-military cars and buses-are included in the category "Exports not elsewhere classified."

Parts for aircraft (exports) are not separately identifiable from 1958 on as between military and civilian aircraft, and all aircraft parts have thus been included, with civilian aircraft, in the capital goods category.
Imports of military aircraft and parts are included in the category "Imports not elsewhere shown." Other military imports are either minimal in value or are unidentifiable, and are included, as appropriate, in other end-use categories.

U 256 and U 263, exports, n.e.c., and imports, n.e.s. This category includes transactions and commodities not elsewhere classified or shown. "Exports, n.e.c." includes reexports (exports of foreign merchandise imported into the United States and then reexported with no significant change in form or content), low-value shipments (commodity detail unavailable), a few military items not classified as special category, and special transactions such as goods imported for repair and exported. "Imports, n.e.s." includes low-value shipments, U.S. goods returned (after having been exported), U.S. Government purchases of uranium ores and oxides, and of military aircraft and parts; also includes movies, exhibits, and laboratory, zoo, and show animals, etc. (Exports of uranium, and non-Government imports of uranium, are included in the industrial supplies and materials category.)

U 264-273. Value of merchandise exports and imports, by groups of customs districts, 1860-1970.
Source: U.S. Bureau of the Census, 1860-1880, Statistical Abstract of the United States, 1923 edition, pp. 824-825; 1881-1903, 1924 edition, p. 441; 1904-1944, 1947 edition, p. 921; 1945-1970, unpublished data. Data are published for individual customs districts in Bureau of the Census, Foreign Commerce and Navigation of the United States and Highlights of Exports and Imports, FT 990.

The customs district in which merchandise is entered or withdrawn for consumption is the district shown in the "imports for consumption" statistics. The customs district shown in the "general imports" statistics is the district through which merchandise enters the United States either as an entry for immediate consumption or as an entry into a customs-bonded warehouse. Except for shipments by mail, vessels under their own power or afloat, and certain lowvalued shipments, the customs district through which a shipment clears when it leaves the country is the district to which the export is credited statistically. Shipments are not credited on the basis of the district in which export shipments originate or to which import shipments are destined. For definition of terms, see text for series U 190-196 and U 207-212. Export figures for 1865 and 1870-1878 represent mixed gold and currency values and hence do not agree with the specie values given for total exports elsewhere.

## U 274-316. General note.

The totals of the selected imports and exports, series $U 274$ and U 295, are shown to provide a means of judging the extent to which the selected items account for the total trade of this country. They include only the values of the items shown for each year and are, therefore, a total with a variable composition. Additional information on the composition of the foreign trade of the United States may be found in M. B. Hammond, The Cotton Industry, American Economic Association Series 2, Nọ. 1, New York, 1897, and in reports by the U.S. Department of Treasury, Bureau of Statistics, on the grain, provision, cotton, coal, iron and steel, and lumber trades of the United States which appeared in the Monthly Summary of Commerce and Finance (hereafter abbreviated as MSCF) for 1899-1900, 1900-1901, and 1902-1903.

Export commodity information is compiled in accordance with the classifications in Schedule B, Statistical Classification of Domestic and Foreign Commodities Exported From the United States. For earlier years Schedule B, Statistical Classification of Domestic Commodities Exported From the United States, and Schedule F, Statistical Classification of Foreign Commodities Exported From the United States, were used. Export commodity information has been compiled in accordance with the Schedule B classifications in effect during those years. Commodities were classified according to physical characteristics or use. These groupings were made on the basis of the materials of which articles were made, the use for which they were intended, and the extent of their refinement or manufacture. In 1965, a revised edition of Schedule $B$ based on the Standard International Trade Classification, Revised (SITC), was put in effect. The 1965 edition was developed with the primary
objective of instituting a classification system providing for those detailed characteristics which permit comparison of the U.S. export statistics with foreign trade statistics of other countries reporting in terms of SITC, as well as data on domestic production. The statistics shown for 1960-1964, which were initially compiled in accordance with the Schedule B classifications in effect during those years, have been recompiled in terms of SITC classifications. It should be noted that some difficulties were encountered in relating the Schedule B classifications to the SITC and, because of differences between these two classification systems, it was necessary to assign some Schedule B numbers to SITC groups on the basis of judgment. Therefore, comparisons of 1960-1970 data for SITC groups with corresponding data for prior periods should be made with caution.

For periods prior to 1963 , import commodity information was compiled in terms of the commodity classifications contained in Schedule A, Statistical Classifications of Commodities Imported Into the United States. Effective with the statistics for 1963, import data are compiled in accordance with the classifications in the Tariff Schedules of the United States Annotated (TSUSA), an official publication of the U.S. Tariff Commission embracing the legal text of the Tariff Schedules of the United States (enacted into law by the Tariff Classification Act of 1962) together with statistical annotations.

Effective with the statistics for 1964 , a revised Schedule A classification system was established, based on the Standard International Trade Classification, Revised (SITC). This edition of Schedule A was constructed (1) to provide for the summarization of data for the approximately 10,000 TSUSA classifications into about 2,300 commodity groupings that are meaningful in terms of commodities important in the U.S. import trade and (2) to provide data in terms of the SITC outline that are comparable, insofar as comparison is possible, to the foreign trade statistics compiled by other trading nations.

As with export commodity statistics, difficulties were encountered in relating Schedule A classifications to TSUSA and SITC classifications; therefore, comparisons between 1963-1970 data and prior periods should be made with caution.

## U 317-352. General note.

Imports are shown according to country of origin and exports according to ultimate destination. When the final destination is not known the shipment is credited statistically to the country to which it is consigned. Accurate information on country of origin is difficult to obtain. Consequently, the directional breakdown of foreign trade is at best approximate.
Trade with Canada and the United Kingdom, particularly, is difficult to measure. Considerable U.S. merchandise normally moves to foreign destinations via Canada and some moves across Canada to destinations in the United States, notably from ports in Michigan to ports in New York. At times such movements have been counted as trade with Canada. Also, considerable Canadian trade with other countries moves through the United States. A good deal of United States merchandise has been consigned to the United Kingdom and reexported to other markets by the United Kingdom, as can be observed by the difference between general imports and retained imports in the United Kingdom's record of trade with the United States.

Special studies of U.S.-Canadian trade have been made from
time to time. In this connection, see the headnote to the table, p . 295 of Commerce Yearbook, vol. II, for 1931; and see MSCF, June and July 1898, pp. 2084-2089, where it is also noted (p. 2075) that "exports to Canada are incomplete prior to April 1, 1893, the date on which the law requiring exporters to clear their goods exported by railways went into effect." For an effort at adjusting the U.S. trade record for this deficiency and the similar lack of coverage in the report of trade with Mexico, see tables 2 and 3 of Matthew Simon's "The United States Balance of Payments, 1861-1900" published by the National Bureau of Economic Research in Studies in Income and Wealth, vol. 24, 1960. For a discussion of shortcomings in the U.S. record of trade with the United Kingdom in the early years of the Civil War, see the Treasury's report in 1864 to Congress, Statistics of the Foreign and Domestic Commerce of the United States, p. 37 ff .
For certain periods, like the Civil War and the greenback era, partners' records of trade with the United States are more reliable than the U.S. record and in some ways more revealing of certain aspects of the trade.
For 1862-1879, exports of domestic merchandise are mixed gold and currency values. Imports and reexports, however, are specie values. The extent of the adjustment can be observed by comparing figures from series U 317 with those in series U 190.

Prior to 1873, trade figures for Canada are actually trade figures for all of British North America, a somewhat larger area than the Dominion of Canada. Asia includes the Philippines in all years and Turkey in Europe for 1926-1951. Oceania includes Hawaii prior to 1901. Europe includes the Soviet Republic in Asia since 1923 and Iceland in all years (Iceland was included with northern North America in Historical Statistics of the United States, 1789-1945).

The source for these series for 1821-1881 is the Treasury Department, Bureau of Statistics, Monthly Summary of Commerce and Finance, hereafter abbreviated as MSCF.

1 Includes beverages.
${ }^{2}$ Beginning 1950, for security reasons, a small amount of semimanufactures included with finished manufactures.
${ }^{3}$ Imports for consumption are as follows (in millions of dollars): Series $\mathrm{U} 219,1,433$; series U 220,420 ; series U 221 , 215 ; series U 222,191 ; series U 223,290 ; and series $\mathrm{U} 224,317$.

Series U 225-248. Indexes of Quantity and Unit Value of Exports and Imports, by Economic Class: 1879 to 1970

| Year | U.S. domestic exports ${ }^{1}$ |  |  |  |  |  |  |  |  |  |  |  |

- Represents zero. Z Less than $\$ 500,000$.

For security reasons, exports of special category commodities are excluded from totals for certain countries. Beginning 1950, exports reflect declassification of special category data authorized July 28,1965 and January 5,1968 , and relaxation of security restrictions as authorized July 17, 1969.
${ }_{2}{ }^{2}$ Prior to 1873 , data are for trade with British North American Provinces which is a somewhat larger area than the Dominion of Canada. In the year ending June 30, 1873,
the U.S. traded with British North Arnerican Provinces the following amounts: Exports, $\$ 34.6$ million and imports, $\$ 37.6$ million. Beginning 1950, includes Newfoundland and ${ }_{a}$ Prior to January 1952, East and West Germany; thereafter, only West Germany. 4 Figures in italics inciude gold and silver-
${ }_{5}^{5}$ Beginning 1954, excludes Ryukyu Islands. No records available prior to 1855.
6 Includes Puerto Rico.
7 For 9 months.

# Business Enterprise 

# Business Population (Series V 1-107) 

## v 1-107. General note.

Statistics on the total number and the size distribution of business firms must be used with caution. No governmental process records all firms, and an entirely satisfactory definition of a firm seems impossible. The boundary between self-employment and conduct of a business firm is hazy at best. In addition, there are problems of inactive or partly (e.g., seasonally) inactive firms, joint ventures, partial interests, ownership of multiple firms by individuals and families, etc. Moreover, the characteristic which causes an enterprise to be counted as, for example, a corporation, an employer subject to social security, or an operator of an establishment requiring a sanitary or safety license, varies with laws creating these categories and with degree of thoroughness of administration of these laws.

These difficulties are compounded when an attempt is made to group firms into industrial categories, because industry boundaries must be arbitrary, and the assignment of a firm on one side of the boundary or another may be based on a 50 -percent rule or on some convention lacking analytic justification. Or the activity may not fit well into any recognized category.
The statistical importance of these problems is great because of the unusual size distribution of the business population, which contains a large number of very small firms, and a minute proportion of larger firms accounting for a substantial or even predominant fraction of total activity. Many small firms are on the boundary line between recognition and nonrecognition (enumeration or nonenumeration), so that a slight difference in method or source, particularly one of which the statistician is unaware, may generate considerable but spurious change or absence of change in the total number of firms. If, however, the object of estimation is not number of firms but total activity, the radically unequal size distribution becomes a great advantage because it permits more efficient sample design at lower cost.

The number and percentage of business firms, therefore, must be used with a realization that the meaning of a business firm is not always certain and that the figures are subject to considerable error. The most meaningful statistics of the business population are those which are based on some consistent criterion or definition over a period of years. The business population studies of the U.S. Bureau of Economic Analysis may be said to have inaugurated the publication of such satisfactory statistics.
The record of one particular year's activity is in effect a single observation out of the infinite number which might be generated by the structural condition which is the object of measurement. Strikes, accidents, and cyclical fluctuations, with highly unequal impact upon various branches of industry, cause a divergence of the actual year's activity from the theoretically true or representative (average) year. Furthermore, if the incidence of mergers (series V 38-39) is substantial, a given year may be the peak or trough of a short-run change in concentration. Moreover, concentration measures may be strongly affected by the arbitrary nature of industry subdivisions, changes in industry classification between census years, and turnover of companies among those designated as the largest.

V 1-12. Proprietorships, partnerships, and corporations-Number, receipts, and profit, 1939-1970.

Source: U.S. Internal Revenue Service. Statistics of Income, Business Income Tax Returns, 1965 and 1968 issues; Statistics of

Income, Individual Income Tax Returns and Statistics of Income, Corporation Income Tax Returns, various issues; and unpublished data.

Proprietorships, partnerships, and corporations encompass virtually all American businesses except those reported to the Internal Revenue Service by fiduciary agents of estates and trusts and the business activities of "exempt" organizations.
"Proprietor" applies to anyone with income from a single-owner business who had specified minimums of self-employment income or gross income during the year. (For historical details, see Statistics of Income, Individual Income Tax Returns, 1965, p. 206.) Thus, the proprietorship data cover the farmers, businessmen, and professionals who are in business for themselves on a full-time or part-time basis. Generally, a proprietor corresponds to a "self-employed" person, other than partners. However, some types of persons defined as selfemployed in the Internal Revenue Code are not considered as businessmen in the tax returns report. The most important of these are clergymen and public officials, such as sheriffs, notaries public, etc. Often, classification of a person as a proprietor depended entirely on how he reported his income.
"Partnership" applies to any group of two or more persons conducting a business for profit unless it is specifically classified as a corporation for tax purposes.
"Corporation" includes most businesses incorporated under State law and, in addition, many unincorporated associations, such as mutual insurance societies, savings and loan associations, and real estate investment trusts.

V 1, V 4, V 7, and V 10, number of business organizations. Represents the number of active businesses operated as proprietorships by individuals, the number of active partnerships, and, for corporations, the number of active corporation tax returns filed, including those for small business corporations. The total number of corporations is slightly understated to the extent that subsidiary corporations are included in a consolidated return filed by a parent corporation.

V 5-6, business receipts and net profit (less loss) for proprietorships. In general, series V 5 represents gross receipts from sales and operations reduced by the cost of returned goods and allowances. Receipts include incidental income from such things as sale of scrap or cash rebates. Dividends, interest, rents, royalties, and other investment-type income are generally excluded, although rents or interest that represent income from business operations are sometimes included (e.g. rents received by real estate operators and interest received by small loan companies). Series V 6 represents the difference between business receipts and the sum of cost of goods sold and other business deductions. It does not reflect investment income; and salaries to owners and contributions or gifts are not allowed as deductions from proprietorship business receipts.

V 8-9, total receipts and net profit (less loss) for partnerships. Series V 8 represents the sum of business receipts (the income from the partnership's principal business activity), investment income such as interest, rents, royalties, nonqualifying dividends, net gain from sale or exchange of noncapital assets, income from farms and other partnerships, and other income. Total receipts do not reflect net losses from the foregoing sources.

Series V 9 represents the difference between total receipts and the sum of cost of sales and operations and other business deductions. The deductions for partnerships exclude both contributions or gifts and additional first-year depreciation.

The term "net profit" is used for both proprietorships and partnerships although it is not strictly comparable for the two forms of business organization. Three differences are (1) investment income is reflected in the partnership, but not in the proprietorship, net profit, (2) salaries paid to the owner(s) are a business deduction for partnerships but not for proprietorships, and (3) additional first-year depreciation is a deduction in the computation of proprietorship, but not partnership, net profit.

V 11-12, total receipts and net profit (less loss) for corporations. Series V 11 includes the gross taxable receipts (i.e., business receipts, taxable investment, income, and certain foreign income) before deduction of cost of sales and operations and net losses from sales of noncapital assets. It also includes nontaxable interest, but excludes all other nontaxable income recognized by the corporation.

The source refers to series V 12 as "net income (or deficit)." It is defined as the difference between gross taxable receipts and the sum of cost of sales and operations and other business deductions allowable for tax purposes. The concept of net income for corporations is not strictly comparable with the concept of net profit for proprietorships and partnerships.

V 13-19. Number of firms in operation, by major industry group, 1929-1963.
Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics). 1929-1939, Survey of Current Business, January 1954, p. 12; 1940-1950, unpublished data; 1951-1958, Survey of Current Business, May 1959, p. 18; 1959-1963, Survey of Current Business, June 1963, p. 2.

These estimates are based primarily on data from the Bureau of Old-Age and Survivors Insurance and the Internal Revenue Service, and are revised from time to time by the Bureau of Economic Analysis (BEA), formerly the Office of Business Economics. The last substantial revision was made in January 1963 and revealed errors in the earlier estimates for absolute number and rate of growth; these errors were due partly to the cumulative effect of imperfect estimates for discontinued businesses. BEA defines a firm as a business organization under one management; it may include one or more plants or outlets. A self-employed person is considered a firm only if he has either one or more employees or has an established place of business. Concerns owned or controlled by the same interests are not combined. Agriculture and professional services are excluded. A firm conducting more than one kind of business is classified by industry according to the major activity of the firm as a whole. Revisions of the Standard Industrial Classification (see Bureau of the Budget, Standard Industrial Classification Manual, 1963) have, therefore, affected the industrial distribution oi firms.

## V 20-30. Business formation and business failures, 1857-1970.

Source: Series V 20 and V 23-30, Dun \& Bradstreet, Inc., 18571919, Dun \& Bradstreet Reference Book and Failure Statistics (a printed mail folder distributed by Dun \& Bradstreet); 1920-1970, The Failure Record Through 1971, and unpublished data. Series V 21-22, U.S. Bureau of Economic Analysis. Series V 21, 1971 Business Statistics, p. 37; series V 22, Business Conditions Digest, June 1971, series B 12.

V 20, total concerns in business. This series represents the number of business enterprises listed in the Reference Book. The figures are for conterminous United States (i.e., excluding Alaska and Hawaii) and represent listings in the books published nearest to July 1 of each year. The listings include types of business which are seekers of commercial credit in the accepted sense of the term; namely, manufacturers, wholesalers, retailers, building contractors, and certain types of commercial service, including public utilities, water carriers, motor carriers, and airlines. Specific types of business not covered are finance, insurance, and real estate companies; railroads; terminals; amusements; and many small one-man services. Neither professions nor farmers are included.

V 21, new business incorporations. This series represents the total number of stock corporations issued charters under the general
business corporation laws of the various States and the District of Columbia. The statistics include completely new businesses that have incorporated, existing businesses changed from the noncorporate to the corporate form of organization, existing corporations given certificates of authority to operate also in another State, and existing corporations transferred to a new State. Data for incorporations in the District of Columbia are included beginning January 1963.
$\mathbf{V} 22$, index of net business formation. This series is compiled from monthly national data on number of new business incorporations, number of business failures, and confidential data on telephones installed. These components are adjusted for seasonal variation and number of trading days before being combined into the index.

V 23-26, business failure rate and business failures. The failure rate is obtained by dividing total failures by the total number of industrial and commercial enterprises listed in the Dun \& Bradstreet Reference Book. Failures are defined as concerns involved in court procedures or voluntary actions, probably ending in loss to creditors. These include, but are not limited to, discontinuances following assignment or attachment of goods, bankruptcy petitions, foreclosure, etc.; voluntary withdrawals with known loss to creditors; enterprises involved in court action such as receivership; businesses making voluntary arrangements with creditors out of court; and since June 1934 (enactment of the Bankruptcy Act), reorganization which may or may not lead to discontinuance.

V 27-30, liabilities. Average liability per failure is obtained by dividing total liabilities by total concerns. Liabilities represent primarily current indebtedness, including accounts and notes payable on secured or unsecured obligations held by banks, officers, affiliates, suppliers, or government at all levels. Beginning in 1933, certain types of enterprises characterized by heavy deferred obligations were eliminated from the data, thus conferring a slight downward bias in average liability figures as compared with earlier years. These series have undergone two revisions. In 1933, they were revised to exclude real estate and finance companies. This revision brought the failure record more nearly in accordance with type of concerns covered by series V 20. In 1939, the series were revised to include voluntary discontinuances with loss to creditors, and small concerns forced out of business with insufficient assets to cover all claims.

V 31-37. Number of new, discontinued, and transferred businesses, by major industry group, 1940-1962.
Source: See source for series $V 13-19$.
New businesses include only firms which have been newly established. Discontinued businesses include closures of all kinds without reference to the reason for going out of business. A firm which is maintained as a business entity but undergoes a change of ownership is counted as a transferred business, not as a discontinuance. Partnerships in which a member is added or dropped, corporations that are reorganized or reincorporated, and businesses sold or otherwise acquired by new owners or changed in legal form of organization (such as partnership to corporation) are considered transfers. Note should be taken of the large differences between figures for failures in series $V 24$ and those for discontinued businesses in series $V 31$.

V 38-40. Recorded mergers in manufacturing and mining, 1895-1970.
Source: 1895-1918, Ralph L. Nelson, Merger Movements in American Industry, table 14, p. 37, Princeton University Press, 1959 (copyright, National Bureau of Economic Research, New York); 19191930, Carl Eis, The 1919-1930 Merger Movement in American Industry, table 1 (reprinted from The Journal of Law and Economics, vol. XII (2), October 1969, The University of Chicago (copyright)); U.S. Federal Trade Commission, 1919-1955, Report on Corporate Mergers and Acquisitions, 1955; 1956-1970, Current Trends in Merger Activity, 1970.

Methods of estimation of the Nelson figures are explained in chapters II and III of his book; the basic source of the figures is chiefly the Commercial and Financial Chronicle. The Eis figures
are an extension of the same series, using essentially the same source material.

Federal Trade Commission (FTC) estimates include mergers reported by Moody's Investors Service, Inc., and Standard and Poor's Corporation. For 1919-1939, the estimates were first made by Willard L. Thorp in various publications, and then continued by the FTC. For complete sources and related data, see the FTC reports cited above.

The annual totals of reported mergers are only a small fraction of all "transferred businesses," as shown in series $V$ 31-37. Series V 38-39 are essentially a count of all mergers and acquisitions involving corporations with widely held or publicly traded securities outstanding. There are two offsetting biases of uncertain amount: Mergers may be announced but not actually consummated; small acquisitions by registered manufacturing companies may be consummated without announcement in the sources used.

The FTC series and the Nelson-Eis series use different sources, each of which changes in degree of coverage over time, and are not comparable. The FTC estimates include a more complete recording of smaller mergers, so that average capitalization or assets per merger would on this account tend to decrease, and total assets to increase. However, value data are not available for this series because the FTC does not collect such data for concerns with assets of less than $\$ 10$ million. Such concerns represented 93 percent of the 1,351 concerns acquired in 1970.

## V 41-53. Number of corporations, by industrial division, 1916-1970.

Source: 1916-1933, U.S. Bureau of Internal Revenue, Statistics of Income, various annual issues; 1934-1970, U.S. Internal Revenue Service, Statistics of Income, Corporation Income Tax Returns, various annual issues.

After 1925, trade is divided into wholesale trade, retail trade, and trade not allocable. The latter, series V 48, varies widely owing to changes in inclusion. The joint figure of wholesale and retail trade for 1916 is not comparable with figures for subsequent years because the "merchandising companies" group was not as inclusive as the "wholesale trade" and "retail trade" groups. This is reflected in the very large figure for all other active corporations. The same is true of "finance, insurance, and real estate" (series V 50) for 1916, then labeled "banks and insurance companies."

V 54-65. Percent of total corporate net income reported by small and large corporations (with net income only), 1918-1939.
Source: U.S. Office of Business Economics, Survey of Current Business, March 1944, p. 11.
The data are based on a special tabulation of corporate income tax records by the then Bureau of Internal Revenue. See general note for series V 1-107.

V 66-77. Income of unincorporated enterprises, by industry, 19291970.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economies). 1929-1963, The National Income and Product Accounts of the United States, 1929-1965; 1964-1967, U.S. National Income and Product Accounts, 1964-67; 1968-1970, Survey of Current Business, July 1972. Table 6.8.
These series measure the earnings of unincorporated business-sole proprietorships, partnerships, and producers' cooperatives-from their current business operations, other than the supplementary income of individuals derived from renting property. Capital gains and losses are excluded, and no deduction is made for depletion.
Estimation in this field has generally required laborious piecing together and adjustment of various types of data from numerous sources. The estimates rely heavily on tax-return tabulations of the incomes of sole proprietorships and partnerships prepared by the Internal Revenue Service.
For a general summary of estimation sources and methods, see Office of Business Economics, National Income, 1954 edition, p. 76 ff.

V 78-107. Manufacturing and trade-sales and inventories, 19481970.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics), 1971 Business Statistics, pp. 23-25.
V 78-87, sales. These are estimated aggregate dollar values for the year. "Sales" means essentially billings or shipments for manufacturing and sales or shipments for retail and wholesale trade. In wholesale trade, however, some respondents probably report orders (bookings) as sales.
V 79-81, sales, manufacturing. As used here, "sales" represents manufacturers' receipts, billings, or the value of products shipped, less discounts, returns, and allowances, and exclude freight charges and excise taxes. Shipments for export as well as for domestic use are included. Shipments by foreign subsidiaries are excluded, but those to a foreign subsidiary by a domestic firm are included. The shipments figures from the Bureau of the Census, Annual Survey of Manufactures, to which these series are benchmarked, include interplant transfers as well as commercial sales. The figures include adjustments for trading-day and calendar-month variations.
V 82-84, sales, retail trade. The definition of sales of retail stores is in accordance with the 1963 Census of Business. Sales are total receipts from customers after deductions of refunds and allowances for merchandise returned by customers, and include receipts from repairs and from other services to customers, sales for resale, and sales and excise taxes. The data represent total sales and receipts of all establishments engaged primarily in retail trade; they do not include sales at retail by manufacturers, wholesalers, service establishments, or other businesses whose primary activity is not retail trade. The breakdown into durable goods stores and nondurable goods stores is based on the durability of the commodities accounting for the major portion of the sales of each kind-of-business group.

Retail sales estimates are developed as direct measures from a sample representing all sizes of stores, firms, or organizations, and all kinds of retail business throughout the country. Because the estimates obtained are based on a sample, the results are not expected to be in exact agreement with those that would be obtained from a complete census of retail stores in which the same enumeration procedure would be used. For details concerning the sample, see 1971 Business Statistics, blue pp. 58-59.

V 85-87, sales, merchant wholesalers. See text for series T 375-383.

V 89-91, inventories, manufacturing. Inventory data are book values of stocks on hand at the end of the period, and include materials and supplies, goods in process, and finished goods. Inventories associated with the nonmanufacturing activities of the company are excluded. Manufacturers' inventories are generally valued at the lower of cost or market price while retail and wholesale inventories are valued at cost of merchandise on hand. About one-fifth of manufacturers' inventories are valued on a last-in-first-out basis (see general note for series V 108-305) which is much less prevalent in trade although it is used extensively by department stores. Changes in the book value of inventories reflect movements of replacement costs as well as changes in physical volume.
V 92-94, inventories, retail trade. These data represent estimated book values of nationwide retailers' inventories, valued at the cost of merchandise on hand. Data for Alaska and Hawaii are included beginning 1946.

The breakdown into durable and nondurable inventories is based on the durability of the commodities accounting for the major portion of the retailers' sales. Thus, nondurable items carried by the retailers dealing primarily in durable goods would be reported in durable goods inventories.

V 95-97, inventories, merchant wholesalers. See the text for series T 375-383.
y 98-107, inventory-sales ratios. See the text for stock-sales ratios, series T 375-383.

Series V 1-12. Proprietorships, Partnerships, and Corporations-Number, Receipts, and Profit: 1939 to 1970 [Number in thousands; money figures in billions of dollars. Based on sample of unaudited tax returns filed for accounting periods ending between July 1 of year shown and

# Corporate Assets, Liabilities, and Income (Series V 108-332) 

## V 108-305. General note.

Aggregate balance sheet and income data for all U.S. corporations combined and for corporations classified by major industry have been published annually since 1926 by the Internal Revenue Service (and its predecessor, Bureau of Internal Revenue) in Statistics of Income, part 2. Data classified by asset-size class are also available since 1931. Series V 108-140 and V 167-196 are based on the materials assembled in Statistics of Income. Other sources provide balance sheet and income data for public utilities, railroads, and commercial banks over considerably longer periods. Data for public utility corporations are presented, in condensed form, in series V 197-212. Data for railroads are presented in chapter Q, Transportation, and for commercial banks in chapter X, Financial Markets and Institutions.

Most of the series shown here include aggregates based on the values reported by corporations in their accounting statements. These book values are seldom, if ever, equal to current market values, nor do they correspond to theoretical values computed by economic analysts (e.g., values arrived at on the basis of the expected revenue streams). When the general price level remains stable, individual differences between the book value and the market value (or between the book value and the theoretical economic value) may largely cancel out in the process of aggregation. In times of a persistent inflation, however, book values show a general tendency to fall below current market valuations, while in times of persistent deflation the reverse is generally true. Some specific valuation problems, arising in connection with different types of business assets, are briefly discussed below.

Physical assets. Physical assets owned by business firms include inventories (both finished goods and goods in process) and fixed assets (land, plant, and equipment).

Inventories are usually shown on the balance sheet at "cost or market, whichever is lower." Consequently, in periods of rising prices, book values tend to be below current market values. In periods of falling prices, however, conservative accounting practices require an adjustment in the book value so as to bring it down to the level of the current market value.

Book charges for inventories used up in production were formerly based almost universally on the "fifo" (first in, first out) method of valuation, but a substantial number of firms have switched to the "lifo" (last in, first out) method. These two valuation methods yield different results with respect to reported costs and profits and also with respect to the book value of the year-end inventory. Under "lifo" procedure, the most recent prices are used for the computation of costs. Consequently, reported profits (and, therefore, income tax liability) are reduced in periods of rising prices, but are increased in periods of falling prices, as compared with the amount that would be reported under "fifo."
On the other hand, the year-end inventories are valued at less recent prices on a "lifo" than on a "fifo" basis. Consequently, in periods of price instability the use of "lifo" tends to widen the gap between the book value and the current market value of the year-end inventories.
Except in special cases, a comparison of year-end inventory values does not provide an adequate indication of changes in the physical volume of inventories. When "lifo" is used, a change in the book value of inventory will correctly indicate the change in the physical volume valued at current prices, as long as the volume is increasing. If the physical volume is decreasing, however, a valuation adjustment is required in order to arrive at the current value of the physical
decrement. When "fifo" is used, a valuation adjustment must be made whether the physical volume is increasing or decreasing.

Since the aggregate inventcry values represent a combination of "fifo" and "lifo" inventories (the former being the predominant component), an inventory valuation adjustment is clearly required before any inferences regarding changes in the physical stock are to be drawn from these figures.
Fixed assets include durable capital goods, which are generally entered at cost and are written off gradually over a period of years by means of annual depreciation charges. A detailed balance sheet usually includes (a) the gross amount before depreciation, (b) the depreciation reserve accumulated to date, and (c) the net amount after depreciation, which is equal to (a) minus (b).

If the prices of capital goods remained constant, the gross amount of plant and equipment would equal their replacement cost (the cost of replacing the existing items, which vary in age from almost new to being close to the time of retirement, with brand new items of the same type). During periods of continual price increases, however, the gross amount falls considerably short of the replacement cost; while during periods of continual price declines, the opposite is true.

The net amount of plant and equipment would approach the current market value only if the annual depreciation allowances corresponded to the actual loss of value through wear and tear as well as obsolescence (and, furthermore, if the prices of new capital goods remained constant). This, however, hardly ever happens in actual practice. Most corporations have been using the "straight line" method of depreciation, under which durable equipment has been written off by equal amounts every year during its entire lifetime, irrespective of the actual degree of wear and tear or obsolescence. During and after World War II accelerated writeoffs were allowed in industries working for defense, whereby plant and equipment could be written off over an arbitrary 5 -year period. This procedure, coupled with the fact that prices generally rose at a relatively fast rate during the war and the postwar period, has served to further widen the gap between the net book values and the actual market values of fixed assets.

Neither the gross nor the net amount of plant and equipment may be taken to reflect accurately changes in the physical stock of durable capital goods. If prices remained constant, changes in the gross amount would indicate changes in quantity, though not in quality, of capital goods. For example, if a firm owned 100 units of machinery and added 10 new units next year, the gross amount would show a 10-percent rise (assuming no retirements during the year); but the gross amount could not show the decline in quality of the original 100 units through the process of aging. The net amount does reflect the aging of durable equipment but, as stated above, the prevailing depreciation methods do not-and are not intended to-align the book values with changes in the actual market value over time.

Financial assets. Financial assets of corporations represent their claims on other business units, individuals, and government. Current (short-term) financial assets include cash, bank deposit accounts, notes receivable and marketable securities (mostly U.S. Government but frequently including marketable corporate stock as well). Noncurrent (long-term) financial assets consist of bonds, other long-term debt instruments, and nonmarketable securities which are largely permanent holdings of corporate stock. The problem of market valuation does not, of course, arise in connection with cash and bank deposits. If receivables are salable, their market value does not ordinarily deviate from the book amount by more than a moderate
discount. But in the case of securities, especially common stocks, the current market value may differ widely from the original cost to the owner. Bonds tend to rise in price when the current interest rate declines relative to the coupon rate. Stocks tend to rise when the expected rate of profit and/or dividends earned by the issuer increases. Conservative accounting practice requires that securities be valued at "cost or market, whichever is lower." Thus, while the book values are not expected to exceed the market values for any considerable length of time the reverse relationship may continue indefinitely.
While the market value of stocks tends to rise with-though not necessarily in proportion to-the general level of prices, the market value of bonds is not directly affected by this factor. In fact, in times of inflation or deflation, the fixed amount debt instruments become especially variable in terms of real purchasing power represented by them.
A special problem arises in connection with financial assets when aggregate balance sheets are compiled. In a closed economic system all financial claims and liabilities would cancel out. A consolidated balance sheet for the entire system would show only physical property on the asset side and net claims to this property by individuals on the liability side.
Since the corporate sector of our economy is not a closed system, a consolidated balance sheet for all corporations combined would not eliminate all financial assets and liabilities, although it would eliminate a substantial part representing intercompany claims.
The aggregate balance sheets presented in this section are essentially unconsolidated data. Some large corporations submitted consolidated balance sheets comprising the parent company and its subsidiaries. (Consolidated returns were permitted prior to 1934 and then again after 1942. See text for series V 108-140 and V 167-196.) But, in the main, the total amounts were obtained by mere aggregation rather than consolidation of individual companies' statements.
As a result, the total amounts of both receivables and payables include a certain (undetermined) amount owed by corporations to other corporations. The total amount of investments includes a certain (undetermined) amount of corporate securities owned by corporations. When claims of the creditor corporations on the debtor corporations are included in total assets of the sector as a whole, the total is inflated by the double-counting involved.

Liabilities. The valuation problems encountered in connection with corporate liabilities are generally similar to those discussed above in connection with financial assets. When the price level rises, the amount of debt shrinks in terms of real purchasing power. When the market value of assets increases, the dollar amount of debt remains unchanged, but its magnitude in relation to net worth (valued at market prices) declines. When unconsolidated data are aggregated, the total amount of debt is inflated because no adjustment is made for intercompany liabilities.

The item designated as "other liabilities" (series V 123) includes accrued income tax and other accrued liabilities. Tax accruals were a relatively minor item during the 1920 's and 1930 's, but assumed major proportions during and after World War II, when the income tax rates were sharply raised and the excess profits tax was imposed (during 1940-1945 and again during 1950-1953). Tax accruals rose substantially also in the years of World War I, but a sharp decline occurred after the war. These movements are reflected in the sample data for large manufacturing corporations, extending over the 19141943 period (see text for series V 285-305).

The amount of accrued taxes has not been reported as a separate balance sheet item in Statistics of Income. Until recently, the yearend amount of tax accruals usually was fairly close to the current year's total tax liability (series V 137, V 180, and V 195), but the acceleration program enacted in 1954 placed large corporate taxpayers on a pay-as-you-go basis, which tended to reduce their tax reserves.
The rise in the income tax accruais on the liability side of corporate balance sheets was accompanied by an increase in government security
holding on the asset side. Thus, in a completely consolidated statement for the corporate sector, the debt owed by corporations to the government would be largely offset by the debt owed by the government to corporations, and the net balance of such claims would be relatively small.

Net worth. Net worth (or equity) is the stockholders' share in the total assets of a corporation. It is not measured by the capital stock account alone, but is equal to the sum of capital stock, capital reserves, paid-in surplus, and earned surplus; or, alternatively, it represents the difference between total assets on the one hand and the sum of all short-term and long-term liabilities on the other. Since the dollar amount of liabilities is fixed at any one time, a revaluation of assets results in a corresponding change in net worth.

In a newly established firm, net worth is equal to the amount of capital paid in by its first stockholders. This amount may be registered in the capital stock account alone, or partly (usually up to the par value per share) in the capital stock account and partly in the paid-in surplus (or capital surplus) account. A going concern, on the other hand, can increase its net worth from two sources-by selling additional shares of stock and by retaining profits. The latter method (known as internal financing) has generally been a very important source of funds for American corporations.
Net profit retained in a given year is reflected in the year-end balance sheet as an increase in the earned surplus account. However, the amount of earned surplus shown on the balance sheet may not generally be taken to represent the sum of all profit retentions over the company's entire lifetime. Many companies declare stock dividends from time to time, and this involves transfers from the earned surplus to the capital stock account. Other companies make occasional transfers from earned surplus to various reserve or special fund accounts. In some cases, earned surplus and paid-in surplus are combined into one account, which makes it impossible to separate paid-in equity from retained funds. Thus, generally speaking, while the balance sheet data for any one year indicate the total amount of net worth, they contain no accurate information as to what portion of net worth has been built up by stock sales and what portion has been accumulated through profit retentions.

Sales, income, and dividends. The sales, income, and dividend figures also represent unconsolidated aggregates, with no adjustment for intercompany transactions. Goods and services sold by corporations to other corporations are included in the total amount of sales two or more times. For example, the value of steel sold by steel producers to automobile manufacturers is included in the sales of the steel industry and also in the sales of the automobile industry (as part of the total value of the automobiles sold). In other words, total reported sales of all industries would exceed by a large margin the net value of corporate production (the sum of all net values added by individual companies) in any given period.

The net income and dividend totals also contain some duplication, since no adjustment has been made for intercompany dividends. When dividends are paid by one company to another, this is obviously a transfer payment which does not increase the actual total income of the corporate sector as a whole. Yet, since such payments are included in net income of the receiving companies without being deducted from net income of the paying companies, the aggregate amount of net income of all corporations is correspondingly inflated.
Problems of asset valuation and income computation have been extensively discussed in the accounting and economic literature. Useful basic discussions may be found in the following books: J. C. Bonbright, The Valuation of Property, McGraw-Hill, New York, 1937; N. S. Buchanan, The Economics of Corporate Enterprise, Heary Holt \& Co., New York, 1940; B. Graham and D. L. Dodd, Security Analysis, McGraw-Hill, New York, 4th ed. 1962; J. P. Powelson, Economic Accounting, McGraw-Hill, New York, 1955.
The problems encountered in compiling the national income data from the balance sheets submitted by business firms are discussed in Office of Business Economics, National Income, 1954 edition, and U.S. Income and Output, 1958.

## V 108-140 and V 167-196. General note.

Aggregate balance sheet data for all corporations submitting such data with their income tax returns have been published in Statistics of Income since 1926. Aggregate income data for all corporations submitting income tax returns have been available since 1916, but income data for corporations submitting balance sheets have been compiled only since 1931.

Companies which did not submit balance sheet data for 1926-1955 represented only a small fraction of the total corporate population in terms of total income and assets. Thus, companies not submitting balance sheets accounted for only 3 percent of the total compiled receipts in 1931 and 1 percent in 1953. The data presented here may, therefore, be taken as a fairly close approximation of the entire corporate population.

For 1926-1950, annual tabulations have been derived from all corporation returns filed. For 1951-1955, the aggregate data for small corporations were estimated on the basis of 10 - and 20 -percent samples, in order to reduce the cost and delay involved in tabulating all returns. In 1951, sampling procedures were confined to corporations with total assets under $\$ 250,000$. The sample amounted to 10 percent of this population. In 1952, the companies with total assets under $\$ 250,000$ were represented by a 10 -percent sample. Furthermore, the companies with total assets between $\$ 250,000$ and $\$ 500,000$ were represented by a 20 -percent sample. All returns with total assets of $\$ 500,000$ and over together with all consolidated returns, life and mutual insurance companies, personal holding companies, and taxable returns with total income (total gross receipts less cost of sales or operations) of $\$ 200,000$ and over, regardless of size of total assets, were tabulated.
For 1953-1957, sampling rates were based on gross receipts instead of total assets. For 1953-1955, companies with gross receipts below $\$ 100,000$ were sampled at a 10 -percent rate; 20-percent of the companies with gross receipts between $\$ 100,000$ and $\$ 500,000$ were sampled and all companies with gross receipts over $\$ 500,000$ were included. In 1956-1957, the 20 -percent sample was expanded to include companies with gross receipts between $\$ 100,000$ and $\$ 1,000,000$. For 1956-1957, all companies with gross receipts over $\$ 1,000,000$ were tabulated.
In 1958, total assets and net income (deficit) were included with gross receipts as a basis for sample selection. In addition, strata were introduced to cover Small Business Corporation returns (Form 1120S). These were filed for the first time under the Technical Amendments Act of 1958.
Beginning 1959, total assets and net income (deficit) only are the basis for sample selection. In addition, separate sampling plans were developed for "special" returns such as life and mutual insurance companies, etc. As a result, there were eighteen sampling classes and eleven sampling rates in 1968 as compared with seven classes and three rates in 1958.
Although small companies account for a very large share of the total corporate universe in terms of the number of returns, they represent a relatively small share of the total in terms of assets and receipts. Thus, in 1952 the total assets of small companies accounted for only 7 percent of the aggregate figure for all corporations combined.
The data in each volume of Statistics of Income are from returns for the calendar year indicated, for fiscal years ending within the period from July of one year through June of the succeeding year, and for partial years with the greater number of months of the accounting period falling within the calendar year. The information is compiled from the returns as filed, prior to revisions that may be made as a result of audit by the Internal Revenue Service. Also, the data do not reflect loss carrybacks, renegotiation of war contracts, or recomputation of amortization of emergency facilities.
The returns included in each report are those filed for comparable periods of time. There are factors, however, which interfere with the precise comparability of the data over a period of years. While their influence has not been so strong as to obscure major historical trends, they must, of course, be borne in mind, especially when close
comparisons are attempted. Some of the more important interfering factors are indicated below.

In general, the items for 1926-1933 are not precisely comparable with those for 1934-1941, because of the discontinuance, under the Revenue Act of 1934, of the privilege of filing consolidated income tax returns (except by railroad corporations and their related holding and leasing companies and, for 1940 and 1941, Pan-American trade corporations), and the consequent appearance, in the separate returns filed by corporations formerly included in an affiliated group, of items which, owing to "intercompany eliminations," did not appear on the consolidated return.
The discontinuance of consolidated returns also resulted in changes in industrial classification. A corporation is classified industrially according to the business reported on the return. When diversified activities are reported, the classification is determined by the industry which accounts for the largest percentage of receipts. Therefore, industrial groups may contain data for activities other than those on which the classification is based. Prior to 1934, a consolidated return was classified on the predominant activity of the group of affiliated concerns, whereas, for 1934 and subsequent years, the separate return filed by each concern which was formerly a part of an affiliated group is classified on its predominant industry. Beginning 1942, the consolidated return privilege was again extended, in general, to all corporations.

On the basis of the data contained in the 1934 issue of Statistics of Income, two sets of figures are given for 1934 in series V 167-181. In 1934 (comparable with later years), corporations which submitted consolidated returns in 1933 are classified according to the business reported on the deconsolidated returns for 1934. In 1934 (comparable with earlier years, insofar as industrial classification is concerned), corporations which submitted consolidated returns in 1933 are classified according to the business reported on consolidated returns in 1933. The latter data for 1934, however, are still not fully consistent with those for 1933 because they include items which are eliminated in consolidated returns but are present in deconsolidated statements.
There have been other changes in the content of various items, which have affected historical comparability. For example, notes payable with maturity of one year or more were included with bonds and mortgages for 1929-1936, but not for succeeding years. Surplus reserves were included with "surplus and undivided profits" for 1926-1937, whereas they have been shown as a separate item since 1938.

The changes in the Standard Industrial Classification System from time to time do not substantially affect the comparability of these data. The figures have been revised historically to reflect these changes which are indicated in the annual volumes of Statistics of Income.

V 108-140. Corporate asset, liability, income, deduction, tax, and profit items, and dividends paid, for all industries, 1926-1970.
Source: U.S. Internal Revenue Service (and predecessor Bureau of Internal Revenue), Statistics of Income, Corporation Income Tax Returns, various issues.

Prior to 1959, the statistics represent only the amounts reported by corporations which supplied balance sheet information; thereafter the statistics also include estimated amounts for corporations which owned assets but did not furnish balance sheet information, as well as selected items (other than assets and liabilities) for returns with zero assets.
V 108, number of corporate returns. Except for 1926, excludes returns of inactive corporations.

V 110, cash. Includes bank deposits.
V 111, notes and accounts receivable. For 1958 and prior years, includes loans to stockholders.

V 113, investments in government obligations. Consists of obligations of all governmental units within the United States and its
outlying areas. Where investments are not segregated between "government" and "other," the entire amount is included in "other investments."

V 115, capital assets. Includes depreciable tangible assets such as buildings, fixed mechanical equipment, manufacturing and transportation facilities, furniture and fixtures; depletable tangible assetsnatural resources; land; and, for 1939-1970, intangible assets such as patents, franchises, formulas, copyrights, leaseholds, goodwill, and trademarks. Prior to 1939, intangible assets were included in "other assets."

V 116, other assets. Consists of noncurrent assets which were not allocable to a specific account and certain accounts for which no distinction could be made between current and noncurrent status. Includes such items as deferred charges reported as noncurrent by the corporation, interest discounts, guaranty deposits, and intangible assets not subject to amortization. Beginning 1959, includes loans to stockholders and "other current assets" such as nontrade receivables, coupons and dividends receivable, claims and judgments, and short term marketable securities. Prior to 1959, loans to stockholders are included in notes and accounts receivable; and other current assets are included in other assets, other investments, or notes and accounts receivable, except for 1956-1958 data, which represent prepaid expenses and supplies only. Prior to 1956 , prepaid expenses are included in other assets. For banks, other assets include property held in trust if included in the banks' assets while, for life insurance companies, they include market value of real estate and that portion of stock and bond holdings in excess of book value.

V 118, notes and accounts payable. Consists of accounts payable and mortgages, notes, and bonds payable with maturity less than one year.

V 119, bonded debt and mortgages. Includes bonds and mortgages payable, regardless of length of time of original maturity, and notes payable with original maturity of one year or more.

V 120, accounts payable. For 1958 and prior years, includes loans from stockholders.

V 123, other liabilities. Consists of obligations which were not allocable to a specific account and were either noncurrent accounts, in general not due within one year, or accounts which could not be identified as either current or long-term. Includes deferred or unearned income not reported as part of a current account, provisions for future taxes based on the effects of either accelerated depreciation or possible income tax adjustments such as for the investment credit, and principal amounts of employee and similar funds. Beginning 1959, includes loans from stockholders; and "other current liabilities" such as accrued expenses, taxes accrued or payable, accrued employee accounts such as payrolls and contributions to benefit plans, dividends payable, overdrafts, accrued interest or rent, and deposits and withdrawable shares of banking and savings institutions. Prior to 1959, loans from stockholders are included in accounts payable; and other current liabilities are included in accounts payable or in other liabilities, except 1957 and 1958 data, which represent accrued expenses only.

V 126, retained earnings, appropriated. Included with surplus and retained earnings, unappropriated, for 1926-1937.

V 127, surplus and retained earnings, unappropriated. Consists of paid-in or capital surplus, and, for 1926-1937, retained earnings, appropriated.

V 130, gross sales and receipts from operations. Gross sales consist of amounts received for goods, less returns and allowances, in transactions where inventories are an income-determining factor. Cost of goods sold is shown as a deduction. Gross receipts from operations consist of amounts received from transactions in which inventories are not an income-determining factor. Cost of operations is shown as a deduction. Gross receipts from operations and cost of operations are not available prior to 1932. The figure shown for 1931 represents gross profit from operations.

V 139, dividends paid in cash and assets other than own stock. Excludes liquidating dividends.

## V 141-166. Nonfinancial corporations, gross product and unit costs, 1948-1970.

Source: U.S. Bureau of Economic Analysis, Survey of Current Business, March 1972, p. 22.

The data presented here consist of annual estimates of the output of nonfinancial corporations, capital stocks and inputs, labor inputs consistent with the Bureau of Economic Analysis (BEA) compensation and employment series, combined labor and capital inputs (total factor input), and profits. The output, profit, and stock estimates are based on the assumption of consistent depreciation practices. Total factor productivity is estimated, as well as the partial productivity of labor and capital separately. Also, rates of return to capital stock are calculated, relating property income to the capital stock valued at current replacement cost.

In interpreting these results it should be kept in mind that the capital input measure is based upon the constant dollar stock of capital owned by nonfinancial corporations, and is thus not adjusted for changes in the degree of utilization of the capital stock. Also, labor input is measured by total man-hours worked instead of the more sophisticated techniques underlying other studies of factor input and productivity, for instance, Edward F. Denison's 1962 study, The Sources of Economic Growth in the United States and the Alternatives Before Us.

The output measure most appropriate for comparison with total factor inputs is output valued at factor cost in constant (1958) dollars, because it excludes capital consumption allowances and indirect business taxes which are not returns to factors of production. This measure is derived by deducting from BEA's measure of constant dollar gross product originating in nonfinancial corporations the sum of constant dollar capital consumption allowances, indirect business taxes (net of subsidies received) and business transfer payments.

The gross product of nonfinancial corporations in current dollars, series V 141, is estimated from the income side of the national income and product accounts. The estimates of compensation of employees, series V 147, are largely based upon data collected from establishments reporting under the unemployment insurance system, with legal form allocations based on data from the economic censuses. The estimates of capital consumption allowances, series V 143 , business transfer payments, included in series V 145, net interest, series V 150, and profits, series V 152-156, are based upon statistical tabulations of income tax returns. Indirect business taxes and subsidies are obtained from government accounting records, with allocations of indirect business taxes by legal form of organization made on the basis of the value of output produced.

The constant dollar measure of gross corporate product, series V 158, is derived from BEA's estimates of gross product by industry by multiplying each industry's real gross product by the percentage of that industry's output attributable to corporations and summing to a total for nonfinancial corporations. Capital consumption allowances and indirect business taxes (net of subsidies) and business transfer payments are estimated in constant (1958) dollars and deducted from gross corporate product in order to provide output valued at factor cost in constant (1958) dollars.

The capital consumption allowances shown in BEA's regular presentation of data on nonfinancial corporations are valued at historical cost and are affected by changes in depreciation practices permitted under Federal tax laws and regulations. To obtain constant dollar output at factor cost, this measure is replaced with an estimate of capital consumption allowances in constant (1958) dollars that is based on the assumption of straight-line depreciation with service lives averaging 85 percent of those shown in Bulletin $F$ of the Internal Revenue Service.

In order to obtain profits based on consistent depreciation practices and current cost valuation, this new measure of capital consumption was also valued at current prices and then deducted from the sum of
profits and capital consumption allowances as shown in the regular presentation. In series V 141-166, the difference between the regularly shown capital consumption allowances at historical cost and the newly computed measure in current prices is shown as the "depreciation adjustment," series V 144. The method for deriving capital consumption allowances in current and constant dollars is discussed in the section on capital stock in the source publication. For the source study, a constant dollar measure of indirect business taxes was derived, and this measure was used to extrapolate the $\$ 1 / 2$ billion 1958 value of business transfer payments less subsidies. Constant dollar indirect business taxes were obtained by extrapolating the value of indirect taxes in 1958 by the output of the taxes commodities and services. Taxes on heavily taxed products or products whose output fluctuated more than average were estimated separately. The value of the automobile excise tax in 1958 was extrapolated by constant dollar auto product; liquor taxes by constant dollar personal consumption expenditures for alcoholic beverages; tobacco taxes by constant dollar personal consumption expenditures for tobacco products; gasoline taxes by the number of gallons consumed; and property taxes on residential structures by the constant dollar net stock of these structures owned by nonfinancial corporations. All other taxes, accounting for 65 percent of the 1958 total, were extrapolated by an estimate of constant dollar net corporate product at market prices excluding corporate product associated with the separately extrapolated items.

V 167-181. Selected corporate asset, liability, income, and tax items, and dividends paid, by industrial division, 1926-1970.
Source: See source for series V 108-140.
Includes Alaska and Hawaii for all years.
V 172, investments. Consists of investments in government obligations, other investments, and mortgage and real estate loans.

V 174, accounts payable and short-term debt. Consists of accounts payable and mortgages, notes, and bonds payable in less than one year.
v 175, long-term debt. Consists of mortgages, notes, and bonds payable in one year or more.

V 177, surplus and retained earnings. Consists of paid-in or capital surplus and retained earnings, appropriated and unappropriated.

V 182-196. Selected corporate asset, liability, income, and tax items, and dividends paid, by size of total assets, 1931-1970.
Source: See source for series V 108-140.
Includes Alaska and Hawaii for all years.
V 187, investments. Consists of investments in government obligations, other investments, and mortgage and real estate loans.
V 189, accounts payable and short-term debt. Consists of accounts payable and mortgages, notes, and bonds payable in less than one year.
V 190, long-term debt. Consists of mortgages, notes, and bonds payable in one year or more.
V 192, surplus and retained earnings. Consists of paid-in or capital surplus and retained earnings, appropriated and unappropriated.

V 197-212. Assets, liabilities, and selected income items for privately owned Class A and B electric companies, 1937-1970.
Source: U.S. Federal Power Commission, all series except V 200202 for 1937-1956, Statistics of Electrical Utilities in the United States, various annual issues; series V 200-202, 1937-1956, unpublished data.
These data cover reports of all Class $A$ and $B$ companies: Class $A$ companies having annual electric operating revenue of $\$ 2,500,000$ or more; Class B companies having annual electric operating revenue of more than $\$ 1,000,000$ but less than $\$ 2,500,000$. In recent years, these concerns have represented approximately 98 percent of the total privately owned electric utility industry.

V 197, total assets or liabilities. For total assets, series V 197 is the sum of series V 198, V 199, V 202, and V 203. For total liabilities, series V 197 is the sum of series V 204-209.

V 198, current assets. Includes cash, special deposits, working funds, temporary cash investments, receivables (less reserve for uncollectible accounts), materials and supplies, prepayments, other current and accrued assets.

V 199, investments. Includes investments in associated companies (less reserve), other investments (less reserve), physical property other than utility plant (less reserve), sinking funds, miscellaneous special funds.
V 200-202, plant and equipment in service. Prior to 1932, firms in the electric utility industry included in their electric utility plant and equipment accounts an increasing amount of "phantom assets" which were created by "writing up" assets above their original cost. Changes in economic conditions and government regulation forced a "write-down" of these "assets" at intervals over subsequent years. Until such "write-downs" were made, however, the figures as published in the annual reports of the Federal Power Commission included decreasing amounts of "phantom assets." However, the figures shown here for series V 197-202 represent revised estimates of the Federal Power Commission and exclude "phantom assets."

V 203, other assets. Includes the "phantom assets" deducted from electric plant and equipment (see text for series V 200-202); electric plant not in service such as plant under construction, leased to others, or held for future use; net utility plant and equipment other than electric; deferred debits; capital stock discount and expenses; and reacquired securities. Although there was some decline in deferred debits, capital stock discount and expense, and reacquired securities, the major portion of the decline in this series between 1937 and 1945 is attributable to the writeoff of "phantom assets." The distribution of these assets for significant years was as follows (in millions):

| Item | 1937 | 1948 | 1956 |
| :---: | :---: | :---: | :---: |
| Total other assets. | \$4,833.9 | \$3,657.3 | \$5,207.1 |
| "Phantom assets" | 2,100.0 |  |  |
| Electric plant not in | 450.0 | 1,472.1 | 1,945.0 |
| Net utility plant other tha | 1,683.6 | 1,876.6 | 2,959.4 |
| Other asset items....-- | 600.3 | 308.6 | 302.7 |

If the "phantom assets" were to be completely excluded from the asset side, a corresponding adjustment would have to be made in the companies' net worth. This has not been done, because it has been deemed advisable to present the capital and surplus figures as reported by the electric companies.

V 204, current liabilities. Includes notes and accounts payable, dividends declared, customers' deposits, accrued taxes and interest, miscellaneous current and accrued liabilities.

V 205, long-term debt. Includes bonds, receivers' certificates, advances from associated companies, miscellaneous long-term debt. Bonds held in treasury were deducted from the total amount of longterm debt outstanding.

V 206, other liabilities. Includes deferred credits, insurance, and other reserves.

V 207, capital stock. Includes common and preferred stock.
V 208, other paid-in capital. Includes premium on capital stock, capital stock discount and expenses, other capital stock items, and reacquired capital stock.

V 209, net surplus. Includes capital and earned surplus.
V 210, total revenue. Includes operating revenues and other income, gross of operating expenses, and all other deductions.

V 211, net income. Equals total revenue less all operating and nonoperating income deductions (including depreciation, interest, and taxes).

V 212, dividends. Includes dividends on preferred and common shares. Excludes stock dividends.

V 213-227. Assets, liabilities, and selected income items for central electric light and power stations, commercial, 1902-1937.

Source: U. S. Bureau of the Census. 1902-1912, Electrical Industries, special reports and bulletins for 1902, 1907, and 1912; 1917-1937, Census of Electrical Industries, reports for 1917, 1922, 1927, 1932, and 1937

See also text for series V 197-212.
Central electric stations are defined as plants owned or operated by individuals, companies, corporations, or municipalities, and furnishing current for public or commercial uses.
Although central electric stations, as defined by the Bureau of the Census, do not represent a group completely identical with Class A and B electric companies, as defined by the Federal Power Commission, the coverage is nearly the same in terms of assets, liabilities, and revenues, as the figures for 1937 show. Consequently, the data in series V 197-212 and V 213-227 may be taken to indicate, with a high degree of approximation, financial trends in the electric utility industry over the entire 1902-1937 period.
Unfortunately, complete balance sheet data for series V 213-227 are available only for 1927, 1932, and 1937. The data for 1912, 1917, and 1922 do not include reserve for depreciation. Consequently, total assets for these years include the gross rather than net value of plant and equipment. The only balance sheet item available for 1902 and 1907 is the gross amount of plant and equipment. The gross revenue, net income, and dividend figures, however, are available for the entire 1902-1937 period.
The accounting nomenclature in series V 213-227 and also in series V 228-272 is similar to that described above for series V 197212. However, financial statements were much less detailed in the early years and accounting procedures did not remain fully consistent over the entire 1902-1937 period.

V 228-242. Assets, liabilities, and selected income items for street and electric railways, 1902-1937.
Source: See source for series V 213-227.
See also text for series V 197-212.
These data relate to all electric railways in the United States irrespective of their length or location and all street railways irrespective of their motive power.
Data for 1902-1922 include companies which operated street and electric railways and were also engaged in other activities, while the data for 1922-1937 include only companies which were exclusively engaged in the operation cf street and electric railways. The double set of figures given for 1922 should enable users to make an adjustment required for comparing the figures for 1927-1937 with those for 1902-1917. For 1917-1937, the total assets include net value of plant and equipment. For 1902-1912, they include gross value of plant and equipment because of the lack of data on depreciation.

V 243-270. Assets, liabilities, and selected income items for telephone and telegraph companies, 1902-1937.
Source: See source for series V 213-227.
See also text for series V 197-212.
The data available for the telephone and telegraph companies for 1902-1937 are even more incomplete than those for the electric utilities. After 1922, the only data collected by the Bureau of the Census were value of plant and equipment, gross income, and dividends paid. During the entire 1902-1937 period, reserves for depreciation were included with other reserves on the liability side and could not, therefore, be used to obtain net value of plant and equipment. Treasury stocks and bonds were reported as a single item (Treasury securities) and could not, therefore, be subtracted from long-term debt and capital stock respectively, as was done for the other electrical industries.
Despite these serious deficiencies, the data throw some light on the rapid development of the telephone and telegraph industries in
the early decades of the 20th century and should, therefore, be useful to those interested in financial trends of these two industries.

V 271-284. Net value of plant and equipment in regulated industries, 1870-1951.

Source: Melville J. Ulmer, Capital in Transportation, Communications, and Public Utilitites, National Bureau of Economic Research, Princeton University Press, 1959 (copyright).

All values in these series are net of depreciation and relate to reproducible fixed assets: Road, plant, and equipment. Investment in land and land rights has not been included. The coverage is confined to privately owned enterprises.
In general, the series have been obtained by cumulative addition (or subtraction) of the annual figures on net capital formation to a base value in some selected year. The series in 1929 dollars reflect changes in net physical stock of reproducible fixed assets. The series in current dollars indicate changes in the replacement value of such assets, less depreciation.

More specifically, the derivation of the series in 1929 dollars involved the following steps:
a. Finding a base-year figure. For steam railroads, the baseyear value was derived from an ICC estimate for January 1, 1937. For electric light and power companies, the value of plant and equipment was assumed to be zero as of January 1, 1881. For telephones, the value for 1880 was derived from estimates of gross capital expenditures in 1878 and 1879. For street and electric railways, the value for 1870 was obtained from the reports submitted to State railroad commissions. For local buslines, it was assumed that net value for 1910 was less than $\$ 100,000$.
b. Converting the base-year figure into 1929 dollars.
c. Deriving the series on net capital expenditures in 1929 prices. This series was obtained by deducting the estimated annual amounts of "true" depreciation from the figures on gross capital expenditures for the corresponding years.
d. Applying the series on net capital expenditures to the baseyear value.

The series in current dollars for each class of utilities was obtained by multiplying the values in 1929 dollars by the construction cost index applicable to that class.

V 285-305. Assets, liabilities, and selected income items for two samples of large manufacturing corporations, 1914-1943.
Source: National Bureau of Economic Research, unpublished data.
These series represent financial data for two samples of large corporations (companies with total assets over $\$ 10$ million each). The data for 1914-1922 are based on a sample of 81 corporations, and the data for 1922-1943 are based on a sample of 84 corporations. These sample materials make it possible to examine financial developments in manufacturing during World War I and the early part of the interwar period, for which time no aggregate data are available.
For both samples, companies were selected from among the largest and most important concerns in 11 major manufacturing industries. A few of the very large corporations (e.g., Ford Motor Company) had to be omitted because of lack of published financial statements, but the number of such omissions was small. Consequently, both samples, though small in terms of the number of firms included, represent substantial portions of the entire manufacturing universe in terms of total assets and total volume of operations. For example, in 1933 the sample represented 29 percent of the total assets of all manufacturing corporations and as much as 45 percent of the total assets of all large manufacturing corporations (with total assets over $\$ 10$ million). (See A. R. Koch, The Financing of Large Corporations, National Bureau of Economic Research, New York, 1943, p. 13.)
In the sample for 1914-1922, data were not available for 8 companies in 1914, 3 companies in 1915, 1 company in 1916, and 1 company in 1917. In the sample for 1922-1943, 3 companies had to be
omitted in 1922, 1 in 1923, 1 in 1924, and 1 in 1925. Since the excluded firms were among the smallest in the samples, however, their omission had a relatively minor effect on the composite balance sheets and income statements.

The amounts of total assets, income, and dividends for the sample for 1922-1943 are considerably greater than those for the sample for earlier years. This is due to the fact that in a number of cases larger companies were substituted in the sample for 1922-1943 for smaller concerns included in the sample for 1914-1922. These differences should be borne in mind when trends over the entire period are examined.

For a more detailed description of these samples, see the unpublished manuscript, Corporate Financial Data for Studies in Business Finance, May 1945, available at the National Bureau of Economic Research.
The accounting terms used in these series are defined as follows:

Total assets: Sum of all asset items less depreciation and revaluation reserves.

Cash: Cash on hand and bank deposits.
Marketable securities: Government securities; call and time loans.

Receivables: Notes and accounts receivable less bad debt reserve.
Inventory: Raw materials; goods and work in process; finished goods; supplies-less reserves for inventory.

Investments and advances: Investment in, or advances to, subsidiaries or affiliated; other stocks and bonds.

Fixed assets (net): Land; plant; machinery; equipment; nonoperating property-less reserves for depreciation, depletion, and obsolescence.

Other assets: Prepaid expenses; deferred charges; intangibles; due from officers, directors, and stockholders; cash set aside for specific purposes or not available for immediate use.

Notes payable: All notes or bills to banks, trade, and others. Accounts payable: Accounts payable to trade.
Other current liabilities: Accruals and current reserves.
Long-term debt: All funded debt or mortgages, whether current or not, less sinking fund when listed on asset side; purchase obligations.

Other liabilities: Minority interest; deferred liabilities; amounts appropriated from surplus for specific purposes; due to officers, employees, and affiliates.

Preferred stock: Preferred and debenture stock less treasury preferred stock when listed on asset side.

Common stock: Common stock (A and B) or capital stock less common treasury stock when listed on asset side.

Capital reserves: Special appropriations from income or surplus for contingencies.
Surplus: Capital and earned surplus less profit and undivided surplus when carried on asset side.
Net income: Net amount after all expenses, interest, and taxes. Dividends: Cash dividends on preferred and common shares. Stock dividends are not included.

V 306-332. Business expenditures for new plant and equipment 1947-1970.

Source: U.S. Office of Business Economics (OBE), 1947-1969, Survey of Current Business, January 1970, p. 25-39; 1970, Survey of Current Business, March 1971, p. 20. Series prepared jointly with U.S. Securities and Exchange Commission (SEC).

These series measure estimated expenditures for new structures and additions to existing plants (including major alterations), as well as expenditures for new machinery and equipment that are chargeable to fixed asset accounts. They include expenditures for replacement purposes and for additions and modernization and exclude expenditures for land, costs of maintenance and repairs, items charged off as current operating expense, new facilities owned by the Federal Government and operated under contract by private companies, and plant and equipment furnished a company by communities and organizations.

Coverage is extended to all private nonagricultural business except real estate operators; medical, legal, educational, and cultural services; and nonprofit membership organizations. The data generally reflect company expenditures, aggregated on a fully consolidated basis, rather than individual establishment data. Each company is assigned an industry classification on the basis of its primary activity, utilizing the Standard Industrial Classification system. Thus, the total capital expenditures of a company for both its primary and secondary activity are included under the assigned industry category. The possible effect of the aggregation of company data in this manner is that the expenditures of one industry could be included in a different industry's total.
Data on plant and equipment expenditures appearing prior to 1947 in a similar OBE-SEC series are not entirely comparable to the series for 1947 to 1970, due to revisions that have occurred. The effect of the revisions, which are benchmarked to data from the 1958 and 1963 censuses, was to increase the rate of growth of capital expenditures over the period for both manufacturing and nonmanufacturing industries.
The gross national product (GNP) series on fixed nonresidential investment ( F 54-56) differs from these series in definition and industry coverage. The GNP investment accounts cover capital expenditures of farm enterprises, professional persons, real estate operators, and nonprofit institutions and include oil well drilling costs charged to current expense, automobile costs used for business purposes, net purchases of used capital goods from government, and dealers' margins on used capital purchases, all of which are not covered or included by these series. The national accounts investment data are derived in a largely indirect manner from a variety of sources, with the equipment component resulting from the utilization, basically, of the commodity flow technique that provides commodity detail. The structures component is obtained in an equally indirect manner from Census Bureau construction data and other sources. In contrast, the OBE-SEC series is based primarily on sample survey results and provides expenditure estimates by purchasing industry.

Series V 108-140. Corporate Asset, Liability, Income, Deduction, Tax, and Profit Items, and Dividends Paid, for All Industries: 1926 to 1970

NA Not available.
I Prior to 1954 , based on original maturity date; beginning 1954, based on date of
balance sheet balance sheet.
${ }^{2}$ Net amount beginning in 1954. For 1937-1953, this is the sum of all positive amounts reported; for 1926-1936, the sum of positive net surplus and undivided profits.
${ }_{3}$ Includes deficit of $\$ 7,655$ million.
${ }^{4}$ For $1937-1953$, this is the sum of all deficits reported ( 1953 deficit, $\$ 7,655$ million); for 1926-1936, sum of net deficits.
1928 "Other investments" were inciuded in "Other assets" for all corporations, 1926928 , and for life insurance companies, 1929
${ }^{6}$ For 1931 , gross profit was reported in lieu of gross receipts and cost of operations. ${ }_{8}^{7}$ Not a vailable separately for returns with balance sheets.
8 Loss.

# Productivity and Technological Development Productivity Indexes (Series W 1-81) 

## W 1-81. General note.

Work in the field of productivity has been carried on by many individuals and organizations, especially the U.S. Bureau of Labor Statistics (BLS) and the National Bureau of Economic Research (NBER). Extensive work is being done by BLS, which measures productivity for the economy and for selected major sectors and industries.
Productivity can be defined generally as the ratio relating output (goods and services) to one or more of the inputs (labor, land, capital, energy, etc.) associated with that output. A variety of productivity measures can be developed, the particular form depending on the purpose to be served. Output per labor input is useful in understanding changes in employment or labor cost. A more comprehensive measure would be output per unit of labor and capital combined which is useful in studying how the economy has used these resources. The latter measures, which have been developed by John W. Kendrick for NBER, are covered in series W 5-8. Their construction is described in the NBER volume, Productivity Trends in the United States, 1961, General Series 71, and in Postwar Productivity Trends in the United States, 1973, General Series 98.

Historically, the measure of productivity which is most commonly used has been output per unit of labor input-frequently called "labor productivity." Such a measure reflects not only labor's effort but also other factors, including state of technology, capital per worker, availability of materials, the efficiency of management, rate of operations, and changes in the composition of the work force. Measures of this type have been developed by the BLS.

The output part of a labor productivity ratio may also be defined in several ways. The simplest one, conceptually, is what is called physical output, where the components are physical units such as pounds, bushels, number, etc. To arrive at total measures for an industry or an industry group, the units are weighted by man-hours or the closest equivalent (such as labor cost or value added). This type of measure is a weighted arithmetic average of the productivity change of its components. The BLS industry estimates are of this type. For a more detailed description of the concepts and procedures used, see chapter 26, BLS Handbook of Methods for Surveys and Studies, Bulletin 1711, 1971.

Estimates for broad aggregates, such as manufacturing or the total private economy, are constructed in terms of another output concept called value added or net output where purchased "intermediate" products consumed in the production process are excluded. This type of measure in relation to man-hours reflects not only the average of the individual industry productivity changes, but also shifts in the relative importance of low- or high-productivity industries.

Man-hours in labor productivity data can refer to either hours worked or hours paid for. The latter include not only hours worked but also paid leave time such as vacations, sick leave, and holidays.

The specific year chosen for the weight base may affect the trend of the productivity series. For example, output valued in 1954 prices would undoubtedly show a different trend from net output valued in 1958 prices. In general, a current year-weighted productivity index gives a lower trend than a base year-weighted index, since items which increase most in volume of output tend to be those with price declines or lower price increases.

Productivity series suffer from statistical limitations which are common to most production estimates. Quality change cannot be adequately accounted for in measuring changes in output; price indexes often do not cover a sufficiently broad industrial area; and man-hour weights for constructing physical output series are frequently not available. Productivity statistics also have additional limitations arising out of the noncomparability of output and manhour series.

## W 1-11. Indexes of national productivity, 1889-1970.

Source: Series W 1-8, John W. Kendrick, 1889-1966, Productivity Trends in the United States, National Bureau of Economic Research, Princeton University Press, 1961, (copyright) and Postwar Productivity Trends in the United States, National Bureau of Economic Research, 1973 (copyright); 1967-1970, computations supplied by John W. Kendrick. Series W 9-11, U.S. Bureau of Labor Statistics, Productivity, Wages, Prices, and Employment, press release issued quarterly, tables 1 and 2.
These indexes are measures of aggregate productivity for the total private economy and the major segments thereof. The NBER series (W 1-8) show the change in real gross product per unit of factor input after adjustments to exclude general government and real net factor income from abroad. The BLS series ( $\mathbf{W} 9-11$ ) exclude only general government and retain real net factor income from abroad. Since the latter amount as a percent of total product is extremely small, the difference between the two series in this regard is relatively small. For both series, the numerator is derived from the Department of Commerce gross national product series (with some adjustments), carried back from 1929 in the case of the NBER series, chiefly by the national product estimates of Simon Kuznets, supplemented by estimates of government purchases by John W. Kendrick.
Although the numerator of the indexes is adjusted gross national product, the indexes are actually measures of the net productivity of the economy. This arises as the result of "netting" out all intermediate purchases of goods and services, thus eliminating duplication and measuring only the "end product" of the system. Indexes of net productivity may therefore move differently from gross productivity indexes according to changes in the efficiency of materials utilization which are not reflected in gross output indexes of productivity.

The indexes are "real" in the sense that price fluctuations have been eliminated by various means. In the NBER series, the net goods and services produced were combined in six segments or "comparison periods" by a Marshall-Edgeworth formula using as weights the average prices in the terminal years of each period. The final production index is thus a chain index with shifting weights between links, but fixed weights within links. Over the long period, therefore, the productivity index reflects the overall shifts in the industry composition of the aggregates. The comparison bases are 1929 for 1889 to 1933 and 1958 for 1929 to 1970.

The output measure in the BLS index is derived from constant dollar aggregates of gross national product published by the Department of Commerce. These aggregates represent the deflation of current dollar values by weighted price indexes. The resultant indexes of net output approximate production indexes with 1958 representing the price base and 1967 the comparison base.

W 1-3, real gross private domestic product per man-hour. This series shows changes in over-all productive efficiency in terms of man-hours as the physical unit of labor input. In general, the estimates of man-hours were obtained by multiplying employment by average hours worked per year in the various industrial groupings. The industry hours were combined to the desired level of aggregation without explicit weights. The exception to the general rule for derivation of total hours occurred in the farm sector where the Agricultural Marketing Service estimates of farm labor requirements in terms of "average adult man-hour equivaients" were used. The AMS estimates were adjusted upwards by 10 percent in all years to attain a level comparable to that of the other sectors.
For the private nonfarm sector, employment data are based upon establishment reports or represent extrapolations of establishmenttype estimates. The estimates since 1929 are by the U.S. Bureau of Economic Analysis (formerly Office of Business Economics). Prior to 1929, they are extrapolations of various benchmark estimates and are largely those used in previous NBER studies of output and employment.
W 4, product per unit of labor input. This series measures net output per weighted man-hour. Man-hours for industry groups or segments were combined by average hourly earnings, using the Marshall-Edgeworth cross-weighting formula. The comparison periods conforming to those in the output index were used. Aside from making possible a comparative study of the movements of output per weighted and per unweighted man-hour, the construction of this index makes possible the combination of the capital and labor inputs and the derivation of indexes of net output per unit of total factor input.
W 5, product per unit of capital input. This series expresses the change in total productivity in terms of real capital assets. The capital input of the private domestic economy was defined to include land and replaceable assets, such as residential and nonresidential structures, equipment, and inventories. The estimates are based primarily on those by Raymond Goldsmith in A Study of Saving in the United States, vol. 3, Princeton University Press, 1956. Index numbers of real capital stocks for separate industry groups were combined by use of the Marshall-Edgeworth formula, using unit capital compensation as weights. The system parallels that used in the index of labor input.
W 6-8, product per unit of total factor input. These series are conceptually more inclusive measures than those shown in series W 1-5 since they relate the quantity of net output to the real quantity of total factor input required to produce it. The index of total factor input is the weighted average of the index of labor input and the index of capital input previously described. The weights are units of factor compensation and the combination was made by applying the Marshall-Edgeworth formula.
W 9-11, real gross private product per man-hour. The output measures used in these productivity estimates-gross product originating developed by the U.S. Bureau of Economic Analysis-are based on a value added concept and represent an unduplicated count of the goods and services produced in an industrial sector. In current dollars, the output data reflect both changes in prices and the physical volume of production. For productivity measurement, only changes in the volume of production are relevant so that output is adjusted for price change and expressed in constant dollars of a base year, which is 1958 for these indexes.
Man-hours refer to hours paid rather than hours worked. They are derived primarily from the BLS establishment data on employment and average weekly hours, supplemented by employment and hours from national income data and the BLS labor force series. The latter is the source of man-hours in the farm sector. Man-hours for the private and nonfarm sectors are the simple aggregate of manhours computed for each industrial sector. Employment and manhours data are published in Employment and Earnings. A complete description of the methods and procedures used to develop these output per man-hour measures appears in chapter 25 of the BLS Handbook of Methods, Bulletin 1711.

W 12. Productivity-index of output per man-hour for production workers, total mining (1929 = 100), 1890-1960.
Source: John W. Kendrick, Productivity Trends in the Inited State, National Bureau of Economic Research, Princeton University Pres, 1961 (copyright).
An earlier index appearing in Harold Barger and Sam H. Schur, The Mining Industries, 1899-1939: A Study of Output, Employment, and Productivity, NBER, New York, 1944, provided the basis ior this series. The earlier index has been extended back by Kendrick to cover years omitted by Barger and Schurr and to include the later period, 1939-1960. Since Kendrick's study of the mining industry was part of a study of national productivity, the need for consistency between the several sectors caused some modification of the Barger and Schurr index.
The mining industry covers all extraction of minerals including stone quarrying and the pumping of crude petroleum. The output index is a price-weighted aggregate of the Marshall-Edgeworth type and is of "modified chain" construction. Separate indexes were computed for each of several comparison perionds using the meak of the commodity prices for the terminal years of each period. The indexes of the comparison periods were then linked to obtain an index covering the entire period.
The general weighting scheme of the uriginal study was followed in the Kendrick revisions, except that he applied national income per unit of output as the weighting factor for combining the broad industry groups into the sector aggregate. These broad groups are metal mining, nonmetallic mining and quarrying, wil and gas wells, bituminous coal, and anthracite. For years prior to 1919, the 19191929 weights were used.
Basic sources of quantity and value data for the original production index were Mineral Resources of the United States, published annually for 1882-1931; and Minerals Yearbook, published annually since 1932-33. These volumes were prepared and issued by the U.S. Geological Survey from 1882 to 1923 and by the U.S. Bureau of Mines since 1924.
Labor input data for 1902 are from the U.S. Bureau of the Census, whereas later data are from accident statistics collected by the Bureau of Mines. The data are man-days used in actual mine operation; in most cases, the average number of employees times the number of days the mine operated during the year. BLS reports on employment and average hours have been used since 1939. The estimates of man-hours are the products of man-days times the "dominal" hours worked per day. Nominal hours are implicitly defined as the number of hours customarily worked on one shift in a regular workday by all persons "engaged in production."

W 13. Productivity-index of output per man-hour for production workers, total mining ( $1947=100$ ), $1880-1950$.
Source: U.S. Bureau of Labor Statistics computations, 1880-1935, based on WPA National Research Project, Production, Employment, and Productivity in the Mineral Extractive Industries, 1880-1938; 1935-1950, based on BLS, Productivity Trends in Selected Industries, Indexes Through 1950, Bulletin No. 1046.
For 1935-1945, the index for mining represents 6 individual mining industries, for 5 of which the BLS published separate series-bituminous coal, anthracite, iron, copper, and lead and zinc. The production index from which the combined index is derived is an average of the 5 separately published series plus a series for crude petroleum and natural gas weighted with current man-hours; the man-hours index is based on totals for the 6 industries. The productivity index for the years before 1935 is based on the WPA National Research Project study.
The individual mining series (W 14-21) are published annually in a BLS release, Indexes of Output Per Man-Hour: Selected Industries. The production data for these series are from the U.S. Bureau of Mines. Employment and average weekly hours series are those of BLS for 1939-1970. For 1935-1939, BLS series were used for the
coal industry and Bureau of Mines data for metal mining. The employment definition adopted (average number of wage earners employed during the 12 months of each year, including months of no activity) is the concept used by the Bureau of the Census.

W 14-21. Productivity-indexes of output per man-hour for production workers, selected mining industries, 1935-1970.

Source: U.S. Bureau of Labor Statistics, 1939 and 1947-1970, Indexes of Output Per Man-Hour: Selected Industries, 1973 Edition, Bulletin No. 1780; all other years, BLS computations.

Production data on which the indexes are based come from the U.S. Bureau of Mines, Minerals Yearbook, and the U.S. Bureau of the Census, censuses of mineral industries. The man-hours components of the indexes are derived from the regularly published BLS series on employment and average weekly hours adjusted by data obtained from the censuses of mineral industries. Exceptions to this are the indexes of man-hours for copper mining and iron mining for 19351939, which were derived from accident analysis statistics of the Bureau of Mines; and the lead and zinc mining man-hours for 19351939, which were derived from special WPA National Research Project tabulations of Bureau of Mines data for 1935-1939. The man-hours cover only production and related workers, and exclude salaried officers, superintendents, other supervisory employees, and professional and technical employees. They include all hours worked or paid for.

W 22-29. Indexes of output per man-hour and output per employed person, 1947-1970.
Source: U.S. Bureau of Labor Statistics, Handbook of Labor Statistics 1972, table 85.

The measures of output per man-hour in the private economy refer to the ratio between constant-dollar gross national product (GNP) originating in the private sector of the economy or individual sectors, and the corresponding hours of all persons employed.

Two series of output per man-hour estimates have been developed. One series is based on labor force data from surveys of households, conducted by the U.S. Bureau of the Census for the Bureau of Labor Statistics. The other series, shown here, is based primarily on BLS surveys of establishments.

The output measure (GNP) used in preparing both series represents the market value (in 1958 dollars) of final goods and services produced in the economy. It includes the purchases of goods and services by consumers, business establishments, foreign investors, and the various government agencies. The GNP data are prepared by the U.S. Bureau of Economic Analysis. The establishment series is based on an hours paid concept and includes the hours of all persons on establishment payrolls in the private economy. In the development of the establishment man-hour series, data from the labor force reports and national income series were used to supplement the BLS payroll series data.

These indexes relate output to man-hours and to employment. They do not reflect the specific contributions of labor, capital, or any other factors of production. Rather, they measure the combined effect of a number of interrelated influences, such as skills of workers, managerial skills, changes in technology, capital investment per worker, utilization of capital, layout and flow of materials, and labormanagement relations.

For a discussion of the BLS indexes and those prepared by the Department of Agriculture's Economic Research Service, see the text for series W 67-81.

The indexes of output per man-hour in manufacturing (series W 25) measure changes in the real value added per man-hour of all wage and salary workers, proprietors, and unpaid family workers. Annual output data used to prepare these indexes are the gross product originating in manufacturing, in 1958 dollars, developed by the U.S. Bureau of Economic Analysis. Gross product originating excludes the cost of materials and other intermediate products consumed in the production process.

Man-hours data are developed by BLS on the basis of establishment data on employment and average weekly hours and refer to hours paid.

For a complete description of the methods used, see chapter 25 of $B L S$ Handbook of Methods, Bulletin 1711.

W 30. Index of output per man-hour for production workers, total manufacturing industries, 1909-1950.
Source: U.S. Bureau of Labor Statistics, 1909, 1914, and 19191939 computations based on Handbook of Labor Statistics, 1947; 1939, 1947, and 1949-1950, Trends in Output Per Man-Hour and ManHours Per Unit of Output-Manufacturing, 1939-53, Report No. 100, 1955.

The production index used to derive the index of output per manhour in manufacturing for 1909, 1914, and the odd-numbered years 1919-1939, is from Solomon Fabricant, Employment in Manufacturing, 1899-1939, NBER, New York, 1942. The production index for even-numbered years to 1939 was computed by use of the Federal Reserve Index for Manufactures. The man-hours index was derived from an employment index based on U.S. Bureau of the Census and BLS data and BLS series for average weekly hours for 1909, 1919, and 1923-1939, supplemented with estimates of the WPA National Research Project for 1920-1922. For 1939, 1947, and 1949-1950, the production index was computed by BLS.

For the period before 1936, indexes of productivity are shown in Production, Employment, and Productivity in 59 Manufacturing Industries, 1919-1936, a 3-volume report prepared by WPA National Research Project on Reemployment Opportunities and Recent Changes in National Techniques. BLS made some revisions in these indexes and extended most of them to 1940. These measures, together with indexes of payrolls and unit labor cost, appear in the BLS report, Productivity and Unit Labor Cost in Selected Manufacturing Industries, 1910-1940, and were later revised. The revised out-put-per-man-hour series was published in the 1947 Handbook of Labor Statistics.

The production pattern changed radically when the United States began its World War II program. Statistics were inadequate for measuring overall changes in manufacturing efficiency during the period of transition from peace to war. Consequently, there is a gap in the measurements between 1939 and 1947.

The index of output per man-hour in manufacturing attempts to compare the labor time required in the current year to manufacture the current year's output of goods with the time required in the base year to produce the same quantity and mixture of goods. That is, it measures the change in output per man-hour, assuming that the proportion of goods produced by each industry and within each industry in each year under consideration was also produced in the base year. It is the ratio of a production index (consisting of an aggregate of quantities produced weighted by the labor time required to produce a single unit) to a man-hours index (based upon the time of production workers). The concept of physical output holds constant the relative importance of industries. Indexes developed under this concept reflect primarily the average change in productivity of plants and industries in manufacturing.

W 31-54. Indexes of output per man-hour for production workers, selected industries, 1919-1970.
Source: U.S. Bureau of Labor Statistics. For data on 1947 base, selected years, Indexes of Output Per Man-Hour for Selected Industries: 1919-1958, April 1959; all other years, computations (1919-1936, based on WPA National Research Project, Production, Employment, and Productivity in 59 Manufacturing Industries, May 1939; 19361939, based on BLS, Productivity and Unit Labor Cost in Selected Manufacturing Industries, 1919-1940, 1942; 1939-1950, based on BLS, Productivity Trends in Selected Industries, Indexes Through 1950, Bulletin No. 1046); for data on 1967 base, Indexes of Output Per Man-Hour: Selected Industries, 1973 Edition, Bulletin No. 1780.

The indexes on the 1939 base were published in 1939 by the National Research Project on Reemployment Opportunities and Recent Changes in Industrial Techniques, a unit of the Works Progress Administration. They were based on data obtained from the U.S. Bureau of the Census, BLS, and other official and private agencies. BLS made some revisions in these series, and extended most of them through 1945. These extended and revised indexes were published, together with indexes of unit labor cost, in a series of BLS publications, Productivity and Unit Labor Cost in Selected Manufacturing Industries, 1919-1940, and several supplements to this report. All measures in these series refer to output per production worker and are based on an aggregate of production worker man-hours.

Relative to the data on the 1967 base, the source warns that the industries covered are not necessarily a representative cross section of U.S. industry, and their output per man-hour indexes should not be combined to obtain an overall measure for the entire economy or any sector. Each index represents only the change in output per man-hour for the designated industry or combination of industries.

Output per man-hour indexes are obtained by dividing an output index by an index of aggregate man-hours. Although the measures relate output to one input-labor time-they do not measure the specific contribution of labor or any other factor of production. Rather, they reflect the joint effect of a number of interrelated influences, such as changes in technology, capital investment per worker, and capacity utilization. Industry output per man-hour measures are limited to the extent that they do not account for quality change, and often do not reflect adequately changes in the degree of plant integration and specialization. In addition, there is not always strict comparability between output and labor input estimates. Finally, year-to-year changes in output per man-hour are irregular, and therefore not necessarily indicative of basic changes in long-term trends. Conversely, long-term trends are not necessarily applicable to any one year or period in the future.

## W 55-59. Indexes of output per worker in transportation, 1869-1966.

Source: John W. Kendrick, Productivity Trends in the United States, National Bureau of Economic Research, Princeton University Press, 1961: and Postwar Productivity Trends in the United States, National Bureau of Economic Research, 1973. (Copyright.)

These series represent revisions and extensions of data by Harold Barger, The Transportation Industries, 1889-1946: A Study of Output, Employment and Productivity, NBER, New York, 1951. In addition to extending Barger's index, Kendrick also created an index for the trucking industry which was not separately presented in the earlier study. For details concerning underlying data and computations for these series, see the sources cited.

W 55, output per worker in all transportation industries. This index measures the change in the movement of persons and property for hire per worker employed and includes the industry groupings of the national income accounts which follow closely the U.S. Office of Management and Budget, Standard Industrial Classification Manual.

The production index used as the numerator is based upon revenue passenger-miles and unweighted ton-miles wherever possible. Where these items were not available, less refined units were substituted, as indicated for individual industries below. Output figures were not available for industries which, in 1929, amounted to some 20 percent of the total. For these industries, output was derived from employment on the assumption that the productivity of the uncovered portion was the same as in the covered portion. The aggregate production index of the industry was derived by weighting together the group indexes using changing national income weights and applying a Marshall-Edgeworth formula.

The employment index is based upon the U.S. Bureau of Economic Analysis (BEA, formerly Office of Business Economics), employment series since 1929. For 1870-1930, the series was extrapolated by estimates of the distribution of gainfully employed workers in census years, adjusted to exclude the unemployed.

Although only output per worker is presented here, the Kendridk series afford measures of output per man-hour for total transportation and for most individual industries.

W 56, output per worker in railroads. The output of this industry includes the freight and passenger activities of Class I, II, and III line-haul roads, switching and terminal companies, the Pullman Company, and the Railway Express Agency and its predecessors.

The production index is a weighted average of simple ton-miles and revenue passenger-miles with different weights for the different classes of passenger service.

W 57, output per worker for pipelines. This index covers companies primarily engaged in the pipeline transportation of crude petroleum and refined petroleum products. Transmission of natural gas is not included. It includes trunkline mileage in interstate as well as intrastate transmission. Gathering lines are excluded.

W 58, output per worker in waterways. The productivity estimates of waterways measure the output per person employed on U.S. flag vessels in coastwise, intercoastal, Great Lakes (domestic), inland, noncontiguous, and international water transportation. The exception is that Great Lakes passenger traffic is not included.

W 59, output per worker in airlines. The productivity estimates for this industry relate to scheduled airlines and unscheduled carriers and companies primarily engaged in operating fixed facilities or providing services to airlines.

W 60-61. Indexes of output per person and per man-hour in distribution, 1869-1969.
Source: See source for series W 55-59.
These indexes represent revisions and extensions of an earlier index prepared by Harold Barger, Distribution's Place in the American Economy Since 1869, Princeton University Press, 1955. The original estimates by Barger represented real margin earned per man-hour on those goods reaching the public through retail stores only. The quantities sold through retail stores were weighted by average 1869 and 1929 distributive margins to derive the production aggregate. The index is thus a "net" concept, although it is more inclusive than the usual net productivity index since packaging and other supply materials customarily considered a part of margin are not eliminated.

## W 62-63. Indexes of output per employee and per man-hour, 1948-1970.

Source: U.S. Bureau of Labor Statistics, Indexes of Output Per Man-Hour: Selected Industries, 1973 Edition, Bulletin No. 1780.

W 62, index of output per employee in air transportation, 1947-70.
Output is measured by passenger-miles and freight ton-miles for all of the certificated air carriers. Unit revenue weights are used to combine the different output services. The index series refers to output per employee (production and nonproduction workers); manhour data are not available. Employment data are from the Civil Aeronautics Board.

W 63, index of output per employee in petroleum pipelines, 1947-69.

The output measure is computed from the annual barrel-mile total of crude oil and products. All basic output data are published by the Interstate Commerce Commission. The index series refers to output per employee (production and nonproduction workers). Prior to 1958 man-hour data are not available. However, from 1958 forward, output per man-hour measures are available and are published in the source cited. All employment measures are computed by BLS.

W 64. Index of output per man-hour in railroad transportation, 1916-1970.
Source: U.S. Bureau of Labor Statistics, 1939, 1947-1970, Indexes of Output Per Man-Hour: Selected Industries, 1973 Edition, Bulletin No. 1780; all other years, BLS computations (1916-1935, based on Witt Bowden, "Productivity, Hours, and Compensation of Rail-
road Labor, 1933-1936," Monthly Labor Review, July 1937; 1935-1947, based on BLS, Trends in Output Per Man-Hour, 1935-1955, Selected Nonmanufacturing Industries, Report No. 105, June 1956).
The index of output per man-hour for railroad transportation refers to Class I railroads and Class I switching and terminal companies. For 1935-1970, the production measure represents aggregate passenger-miles and freight ton-miles, each category being weighted by fixed period average unit revenue weights. The man-hours index represents straight time worked and overtime paid for all employees (production and nonproduction workers) and also includes constructive allowance hours of train and engine employees. Constructive allowance time includes vacations, standby time, held-over time, court time, etc. All basic data are published by the Interstate Commerce Commission.
The indexes for 1916-1934 are based on a somewhat different index prepared by BLS. The components of the production index are combined with 1926 weights; and for 1916 through July 1921, the man-hours represent time worked rather than paid.

W 65. Index of output per man-hour in the gas and electric utilities industry, 1939-70.
Source: U.S. Bureau of Labor Statistics, Indexes of Output Per Man-Hour: Selected Industries, 1973 Edition, Bulletin No. 1780.
Output is measured in terms of energy sold (kw.-hr. of electricity and therms of gas) by privately owned gas utilities, privately owned classes A and B electric utilities, and REA borrowers. Unit revenue weights are used to combine the different output series. The index series refers to output per man-hour for all employees (both production and nonproduction workers). Employment and man-hour data are from BLS.

W 66. Indexes of output per man-hour for nonfinancial corporations, 1948-1970.
Source: U.S. Bureau of Labor Statistics, Productivity, Wages, Prices, and Employment, press release issued quarterly, table 4.

The nonfinancial corporate sector includes all corporations operating in the United States except banks, commodity and stock brokers, credit agencies, and insurance carriers. Output data used to prepare these indexes are the gross product originating in 1958 dollars. These data and compensation (wages, salaries, and supplements) were developed by the Bureau of Economic Analysis. A description of
the methods and procedures used to derive these statistics appears in the May 1967 issue of Survey of Current Business.
Man-hours refer to hours paid and are based mainly on BLS establishment data on employment and average weekly hours. Census data by legal form of organization for 2-digit SIC industries are used to adjust man-hours to the nonfinancial corporate levels.

W 67-81. Index of farm production per man-hour, 1910-1970.
Source: U.S. Department of Agriculture, Economic Research Service, Changes in Farm Production and Efficiency, Statistical Bulletin No. 233.

For a description of the index of farm production, see the text for series K 414-429. The index of farm production per man-hour is the ratio of farm production to labor input. The index numbers are developed by relating the indexes of farm output and production of individual or groups of farm products to the appropriate index of labor input expressed in man-hours (see text for series K 410-413).

Indexes of farm labor productivity reflect the net effect of all factors that affect either farm production or the labor input. Since labor is one of the more important inputs in agricultural production, changes in the ratio of production to labor provide a useful measure of changes in efficiency of farm production.

These series are published annually in the source cited and in Agricultural Statistics.

Caution should be exercised when comparing the ERS series with those of the Bureau of Labor Statistics (BLS) because of differences between "gross" and "net" farm production, and between hours "worked" and hours "required."

BLS computes indexes of production per man-hour for the total private economy, for nonagriculture, and for agriculture. Like the ERS series, the BLS series calculates indexes of farm production in which production data are weighted by constant prices. However, the ERS farm output index is a "gross" index while the production index of BLS follows the GNP approach, which is a "net" index excluding intermediate products.

The BLS series uses both BLS and census labor force data based on hours "worked" and covers men, women, and children over 14 years of age. Thus, the labor input differs from the ERS series which reports hours "required" for agricultural production in terms of manequivalent hours.

The BLS series is applicable for all agriculture only, while the ERS series permits comparisons.

Series W 1-11. Indexes of National Productivity: 1889 to 1970

: Preliminary.

# Copyrights, Patents, and Trademarks (Series W 82-108) 

## W 82-95. Copyright registrations, by type, 1870-1970.

Source: Series W 82-91, W 93-95, U.S. Library of Congress, Annual Report of the Libratian of Congress and Annual Report of the Register of Copyrights, various issues. Series W 92, U.S. Patent Office, 1874-1896, Arnual Report of the Commissioner of Patents; 1897-1940, unpublished data; 1941-1970, U.S. Library of Congress, Annual Report of the Librarian of Congress, various issues.

Additional detail for some series is shown in the source volumes.
Figures are on a calendar-year basis for 1870-1896, and on a fiscalyear basis thereafter. Prior to 1870, copyright claims were entered at Federal District Courts. For additional information on this period, see Martin A. Roberts, Records in the Copyright Office Deposited by the United States District Courts Covering the Period 17901870, Washington, D.C., 1939.

The term "copyright" may be defined as the right to prevent copying. It has come to mean that body of exclusive rights granted by Federal statute to authors for the protection of their writings. It includes the exclusive right to print, reprint, publish, copy, and vend the copyrighted work; to make other versions of the work; and, with certain limitations, to make recordings of the work and to perform the work in public. The Copyright Office is primarily an office of record, and registers claims if the provisions of the law and the regulations have been complied with. A certificate is issued to the applicant upon completion of each registration.

The first law, 1790, applied only to maps, charts, and books. Subsequent amendments provided for prints (1802); musical compositions (1831); dramatic compositions with the right of public performance (1856); photographs (1865); paintings, drawings, sculpture, and models or designs for works of the fine arts (1870); performance rights in music (1897); motion pictures and photoplays (1912); and performance rights in nondramatic literary works (1952). The original term of copyright was 14 years, with the privilege of renewal for 14 years. In 1831, the first term was increased to 28 years, and in 1909, the renewal term was also increased to 28 years. Before 1891, only citizens or residents of the United States could obtain copyrights. The Act of 1891 extended the privilege to citizens of countries with which the United States had reciprocal copyright agreements. Claims in works by citizens of States adhering to international copyright conventions to which the United States is a party (Mexico City, 1902; Buenos Aires, 1910; and Universal Copyright Convention, 1952) may also be registered, as well as works first published in States adhering to the Universal Copyright Convention.

Detailed information on the various classes of works may be obtained by writing to the Register of Copyrights, Library of Congress, Washington, D.C. 20540.

W 82, total registrations. For 1870-1940, the figures shown in this series exclude commercial prints and labels; see text for series W 92, below.

W 83-85, books, pamphlets, and periodicals. Serial publications issued at regular intervals of less than a year are considered periodicals; otherwise, they are considered books.

W 87, dramatic or dramatico-musical compositions. For 1909 and earlier years, this series pertains only to dramatic compositions.

W 92, commercial prints and labels. Registration of commercial prints and labels in the Patent Office was first authorized by the Act of June 18, 1874 . Jurisdiction was transferred to the Register of Copyrights by Public Law 244, 53 Stat. 1142, effective June 30, 1940.

W 94, miscellaneous. Includes lectures, sermons, addresses; reproductions of works of art; drawings or plastic works of a scientific or technical character; and photographs.

## W 96-106. General note.

A patent is a grant by the Government to the inventor, his heirs or assigns, of the right to exclude others from making, using, or selling the invention patented. Patents can be obtained for any new and useful machine, manufacture, composition of matter or process, or any new and useful improvement thereof, subject to the requirements and conditions of the law, United States Code, Title 35, Patents. An invention is "useful" if it has lawful purpose and is operative. Since 1946, inventions useful solely in the utilization of fissionable material or atomic energy for atomic weapons have been unpatentable. If the subject matter patented can be used without infringement of the prior rights of others or violation of any applicable statute, the patent, in effect, gives its owner the exclusive right to make, use, or sell the subject of the patent. The subject matter covered by a patent must be sufficiently new as to be not obvious to one skilled in the art to which it relates.

Patents on inventions have been issued by the Federal Government since April 10, 1790. Both the fees charged and the term of patents have been changed occasionally by law. A total fee of $\$ 30$ was charged on application in 1793 ; now (1973) a base fee of $\$ 65$ is charged. Whereas no charge was made prior to 1861 when a patent was granted, modern-day applicants pay an additional minimum fee of $\$ 110$ at that time. Other smaller fees incidental to the processing of applications may also be charged by the Patent Office.

For 1790-1861, the term of a patent was 14 years. From 1836 until the patents granted in 1861 expired, patents could be extended for an additional 7 years upon application by the patentee and approval of a special board or the Commissioner. About 5 percent of the patents issued during the latter part of this period were extended in this manner. Since 1861, the term of patents on inventions has been fixed at 17 years with extensions possible only by special act of Congress. The number of such extensions has been negligible.

From February 21, 1793, to July 4, 1836, patents were granted on demand of the applicant, upon compliance with the formal requirements, without examination as to novelty and other requirements. Consequently, statistics of patents on inventions issued during this period are more comparable to subsequent statistics of applications for patents on inventions (series W 96) than to subsequent statistics of patents on inventions. Different sources for patent statistics during this period show minor discrepancies.
Since July 4, 1836, the Patent Office has examined applications for novelty and for compliance with the requirements of the statute and not all applications which are filed become patents. See Department of Commerce, The Story of the United States Patent Office, for a brief account of the development of the patent laws; and General Information Concerning Patents (revised periodically), for an outline of the patent law.

Other kinds of patents issued are design patents, botanical plant patents, and reissued patents. Reissued patents are patents which are issued to replace another patent to correct some error, and hence have no significance in most uses of patent statistics. They are not shown in this compilation, although reissue applications are included in series W 96 for some years for which they could not be separated. Reissued patents were numbered separately from 1838; the number of the first such patent issued in 1972 is 27,264 .
Statistics on various phases of patents on invention are available in various sources. Analyses of aggregate patent statistics appear in Barkev S. Sanders, "The Course of Invention," Journal of the Patent Office Society, October 1936; Joseph Rossman and Barkev Sanders, "The Patent Utilization Study," The Patent, Trademark, and Copyright Journal, June 1957; Alfred B. Stafford, Trends of Inven-
tion in Material Culture, Ph.D. thesis, University of Chicago, 1950; Alfred B. Stafford, "Is the Rate of Invention Declining?" American Journal of Sociology, May 1952; Jacob Schmookler, Invention and Economic Growth, Harvard University Press, 1966. Statistics of patents issued by industry or by field of technology appear in Simon Kuznets, Secular Movements in Production and Prices, Boston, 1930; R. K. Merton, "Fluctuations in the Rate of Industrial Invention," Quarterly Journal of Economics, May 1935; Trends of Invention in Material Culture, cited above; and Invention and Economic Growth, cited above. The basic data used in this work, two volumes bound in one, are on file in the Library of the U.S. Patent Office under the title "Statistics of Patents Classified by Industry, United States, 18371957".
Statistics of patents issued by State and country of residence of the inventor appear in the Patent Office, Annual Report of the Commissioner of Patents, and in the Bureau of the Census, Statistical Abstract of the United States. Since 1966, the annual reports have also included applications filed by country of residence, beginning with calendar year 1961.
International patent statistics are given in P. J. Federico, "Historical Patent Statistics, 1791-1961," Journal of the Patent Office Society, vol. 46, Feb. 1964, pages 89-171, which also contains a description of the sources of the statistics for various countries, including the United States. The English Language International Periodical Industrial Property (World Intellectual Property Organization, Geneva), published since 1960 , has an annual statistical supplement in each December issue, which gives data for a large number of countries including, for many, applications filed by and patents granted to residents of other countries, and additional statistics for the United States.

W 96-98. Patent applications filed on inventions, designs, and botanical plants, 1836-1970.
Source: U.S. Patent Office, 1836-1839, The Story of the United States Patent Office, 1790-1956; 1840-1925, Annual Report of the Commissioner of Patents; 1926-1970, unpublished data.
Series W 96 involves a slight element of double counting prior to 1940. Before a change in the law on August 5, 1939, made it impossible, an applicant could permit his initial application to lapse and then file a new application covering the same invention. Possibly 2 to 4 percent of the applications filed before 1940 were of this character. For years prior to 1880 , series W 96 includes design applications, and for years prior to 1877, also includes reissue applications.

## W 99. Total patents issued on inventions, 1790-1970.

Source: 1790-1925, U.S. Patent Office, Annual Report of the Commissioner of Patents; 1926-1970, unpublished data.
Patents for inventions are numbered serially, the number of the first patent issued in 1972 being $3,631,539$. This numbering system, although instituted later, began with the first patent issued after the Patent Act of July 4, 1836. Most sources of patent statistics give, as the annual number of patents issued, the numbers derived by subtracting the serial numbers of the first patent in each year. However, some serial numbers were not used and are blank; that is, there may not be any patent corresponding to a particular number. This may arise when an application scheduled to be patented, with the patent number assigned, is withdrawn for some reason at a time when it is too late to assign that number to some other case. The blank numbers averaged 26 per year for 1939-1955, but only 7.5 per year for 1961-1970. Beginning with the 1970 edition, the Annual Patent Index includes a listing of the blank numbers, for the period 1920-1970. Through 1971 there were 2,998 blank numbers. In the present series the number of blank numbers has been deducted in each year for which it could be ascertained. Therefore, the statistics of patents on inventions issued since 1836 may run a fraction of a percent below those appearing in some issues of the Annual Report of the Commissioner of Patents and in Historical Statistics of the United

States, 1789-1945. Reissued patents are not shown in this compilation.

Patents granted in a given year cannot be compared with applications filed in the same year since there is a variable lag between the time of applying and the time of issuing a patent. During the last 10 years this lag varied between 2 years and 6 months and 3 years and 3 months as the average time for issuing patents. In addition, variations in the number of patents issued in a given year may be due to administrative problems such as the loss or addition of examining personnel, or rearrangement of printing schedules.

W 100-103. Patents on inventions issued to individuals, to U.S. and foreign corporations, and to the U.S. Government, 1901-1970.
Source: 1901-1935, U.S. Patent Office, unpublished data; 19361955, P. J. Federico, Distribution of Paients Issued to Corporations, 1939-1955, Washington, D.C., 1957, Study No. 3, table 6 (a report prepared for the Senate Subcommittee on Patents, Trademarks, and Copyrights); 1956-1970, U.S. Patent Office, unpublished data.
Statistics on patents issued to U.S. and foreign corporations are actual counts for 1931-1937, 1955, and 1961-1970; for the other years they are estimates based on samples. Statistics of patents issued to the U.S. Government are based on actual count. This figure does not include patents issued to the Alien Property Custodian during and after World War II. Patents assigned after grant are not included. The patents issued to individuals are obtained by subtraction from the total.

## W 104. Patents issued on designs, 1842-1970.

Source: U.S. Patent Office, Annual Report of the Commissioner of Paterts, and unpublished data.

Designs became patentable in 1842 and relate to the appearance, not to the structure or use, of articles of manufacture. The term for design patents was initially set at 7 years. Since 1861, the term has been $3 \frac{1}{2}, 7$, or 14 years, at the discretion of the applicant. Fees payable vary with the term. Design patents are numbered separately. The number of the first design patent issued in 1972 is 222,801 .

W 105. Patents issued on botanical plants, 1931-1970.
Source: U.S. Patent Office, unpublished data.
Botanical plants became subject to patents for the first time in 1930. Patentable plants are those which are asexually reproduceddistinct and new varieties of plants other than tuber-propagated plants. The term and fees for plant patents are the same as for patents on inventions. Plant patents are numbered separately from the other patents. The number of the first plant patent issued in 1972 is 3,063 .

W 106. Patents issued to residents of foreign countries, 1836-1970.
Source: U.S. Patent Office, Annual Report of the Commissioner of Patents, and unpublished data.
The volume of patents issued to citizens of foreign countries was influenced in the early years of the patent system by discriminatory legislation. For 1800-1836, only aliens who had resided in the United States for 2 years and who had declared their intention of becoming citizens could apply for U.S. patents. For 1836-1861, aliens paid higher fees than citizens on a theory of reciprocity. Discrimination based on nationality was eliminated in 1861.
This series is based on residence and not on citizenship. It includes patents on inventions, designs, and botanical plants. Separate statistics on components are not available except for recent years. For the 7 years 1951-1957, foreign residents received 12.6 percent of invention patents, 3.3 percent of design patents, and 12.5 percent of the plant patents. For the period 1964-1970, foreign residents received 22.4 percent of invention patents, 7.0 percent of design patents, and 13.5 percent of the plant patents.

W 107-108. Trademarks registered and renewed, 1870-1970.
Source: U.S. Patent Office, Annual Report of the Commissioner of Patents, and unpublished data.
A trademark is a symbol-a picture, word, or phrase-applied by a manufacturer or merchant to distinguish his goods from those of others. Trademark rights are acquired by adoption of a mark and use of it on the goods in trade. The Federal law provides for the registration in the Patent Office of such marks which are used in interstate and foreign commerce. Applications for registration are examined and registration may be refused if the mark is of a characterprohibited registration (national emblems, deceptive marks, purely descriptive marks, etc.) or if it conflicts with a prior registered mark. Federal registration does not create ownership, but only gives additional advantages to the owner. See Department of Commerce, General Information Concerning Trademarks, (revised periodically), for an outline of the requirements for registering a trademark.
The first Federal trademark law, that of 1870 , was based on the
patent and copyright clause of the Constitution instead of the interstate and foreign commerce clause, and was held unconstitutional in 1879. The Trademark Act of 1881 was limited to marks used in foreign commerce. The Act of 1905 included marks used in interstate commerce as well. An Act of 1920 permitted registration of a secondary class of marks not previously registrable. A completely new Act of 1946, effective 1947, provides for a Principal Register on which marks of the type registrable under the Acts of 1881 and 1905 could be registered, and a Supplemental Register on which marks of the type registrable under the Act of 1920 could be registered. Registrations under the Act of 1946 are for a term of 20 years, with renewal possible for successive 20 -year terms. Registrations issued under the Acts of 1881 and 1905 remain in force for their unexpired terms and may be renewed in the same manner as registrations under the Act of 1946. Registrations under the Act of 1920 cannot be renewed unless renewal is required to support a Foreign Registration and in such case may be renewed on the Supplemental Register in the same manner as registrations under the Act of 1946.

Series W 82-95. Copyright Registrations, by Type: 1870 to 1970-Con.

${ }_{1}$ Prior to 1941 , commercial prints and labels not included in total; jurisdiction moved
${ }^{2}$ Prior to 1927, contributions to periodicals included with books and pamphlets. to copyright office in 1940 .

Prior to 1941, excludes renewals of commercial prints and labels.

Series W 96-106. Patent Applications Filed and Patents Issued, by Type and by Patentee: 1790 to 1970

# Research and Development (Series W 109-180) 

## W 109-180. General note.

Historical statistics on research and development expenditures and employment by various groups in the major sectors of the economy are of comparatively recent origin. Public interest in representing the input of research and development activity in terms of some widely used measure, such as funds expended or personnel employed, has been largely incidental to concern with major national issues. During the depression years of the 1930's this interest stemmed from the role that research played in the recovery of the economy. Groups such as the National Research Project of the Work Projects Administration (formerly the Works Progress Administration) and the National Resources Planning Board engaged in studies of the interrelationships among trends in research and development, technological change, unemployment, education, and other major economic and social factors. Their interest in measuring research and development was generally subsidiary to a larger preoccupation with such broad national issues as economic recovery, re-employment, and national planning. The research and development estimates which they published were intended to serve primarily as illustrative background materials.

The period of World War II and its aftermath dramatized the critical place of research and development in the Nation's military security program. Groups concerned with measuring research and development during this period included the Committee on Science and Public Welfare (Bowman Committee), the President's Scientific Research Board, and the Research and Development Board of the Department of Defense. Like the earlier groups, these organizations supplemented fragmentary data already on hand with special inquiries and analyses in order to develop background estimates on research and development trends.

The National Science Foundation, a Federal agency established in 1950, undertook as one of its functions the development of such factual data and related analyses on research and development. As a first step, the Foundation initiated an annual survey of Federal funds for research and development, starting with data on funds for scientific research and development at nonprofit institutions for fiscal 1951 and 1952 and moving thereafter to annual surveys of the funds comprising the "Federal Research and Development Budget."

In 1954, the National Science Foundation undertook the first
effort to measure the volume of research and development activity, in terms of funds and personnel, through surveys of all major types of organizations in the several sectors of the economy which were known to be performing or financing this activity. Out of this effort grew a continuing Foundation program of surveys designed to facilitate preparation of annual estimates on funds and personnel employed in research and development by the major sectors of the economy. Before the National Science Foundation undertook its first surveys, there was no general agreement on such fundamental matters as the definition of research and development; the distinction between the conduct of research and development and such related activities as academic instruction or industrial production; the distinction between basic and applied research and development; and the major characteristics distinguishing various types of research organizations.
National estimates. National estimates of funds spent on the performance of research and development by the four major sectors of the economy have been made by the National Science Foundation for 1953-70. National estimates of funds received from various sources for the performance of research and development have also been made for 1953-70. These series appear in table B-1 of the National Science Foundation publication, National Patterns of R\&D Resources, 1958-72, Funds and Manpower in the United States, (NSF 72-300). An analysis of intersectoral flows of transfers of funds for research and development for 1970 appears in table I, below. This table is based on information obtained in the National Science Foundation surveys of funds for research and development in 1970 as presented in table B-1.
The limitations described below indicate that table I should be considered a general approximation rather than an exact statement of the extent to which the different sectors are participating in the financing and performance of research and development.
Detailed information on the scope and limitations of the various surveys appears in the National Science Foundation publications listed below. Generally speaking, the National Science Foundation surveys seek full enumeration of the various segments. The exceptions are industrial firms and the smaller nonprofit institutions for which sampling procedures are employed.
The data in table I are derived basically from survey responses by performers of research and development as to how much they spent

Table I. Intersectoral Transfers of Funds Used for Performance of Research and Development: 1970
[In millions of dollars, except as indicated. Based on reports by performers]

| Sources of funds, by sector | Research and development performers |  |  |  |  | Total |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Federal Government agencies | Industry ${ }^{1}$ | Universities and colleges ${ }^{2}$ |  | Other nonprofit institutions ${ }^{1}$ | Amount | Percent |
|  |  |  | Total | Associated FFRDC's ${ }^{3}$ |  |  |  |
| Federal Government agencies. | 3,855 | 7,779 | 1,648 | 737 | 745 | 14,764 | 56.7 |
|  |  | - 10,283 | 1,61 | , | 90 | 10,434 | 40.1 1.8 |
| Universities and colleges.-- |  |  | 4461 |  |  | 461 388 | 1.8 |
| Other nonprofit institutions. |  |  | 165 |  | $+223$ | 388 | 1.5 |
| Total | 3,855 | 18,062 | 2,335 | 737 | 1,058 | 26,047 | 100.0 |
| Percent. | 14.8 | 69.3 | 9.0 | 2.8 | 4.1 |  | 100.0 |

${ }^{1}$ Expenditures for Federally Funded Research and Development Centers (FFRDC ${ }^{\dagger}$ s) administered by both industry and by nonprofit institutions are included in the totals of their respective sectors. FFRDC's are organizations exclusively or substantially major facilities for research and training purposes.
${ }_{3}$ Includes agricultural experiment stations.
by Federally Funded Research and Development Centers (FFRDC's) administered by individual universities and colleges and by university-consortia.
4 Includes State and local government funds.
on this activity and where their funds originated. The estimates represent final through-transfers from source organizations financing research and development to performing organizations which ultimately used the funds. Every effort was made to net out intermediate transfers.
Research and development in these series consist of basic and applied research in the sciences (including medical sciences) and in engineering and activities in development, all defined below. In terms of fields, the natural sciences-life, physical, and engineering-as well as the social and psychological sciences are covered in the Federal, universities, and other nonprofit sectors. Industry coverage is limited, at present, to the natural sciences. Research and development excludes routine product testing, quality control, mapping surveys, collection of general-purpose statistics, experimental production, and activities concerned primarily with the dissemination of scientific information and the training of scientific manpower.

Research, which is made up of basic and applied, is systematic, intensive study directed toward fuller scientific knowledge of the subject studied.

Basic research. For three of the sectors-Federal Government, universities and colleges, and other nonprofit institutions-the definition of basic research stresses that it is directed toward increases of knowledge in science with ". . . the primary aim of the investigator being a fuller knowledge or understanding of the subject under study, rather than a practical application thereof." To take account of an individual industrial company's commercial goals, the definition for the industry sector is modified to indicate that basic research projects represent "original investigations for the advancement of scientific knowledge... which do not have specific commercial objectives, although they may be in fields of present or potential interest to the reporting company."
Applied research. The core definition in the NSF questionnaire sent to the universities and colleges is: "Applied research is directed toward practical application of knowledge." Here again, the definition for the industry survey takes account of the characteristics of industrial organizations-it covers "... research projects which represent investigations directed to discovery of new scientific knowledge and which have specific commercial objectives with respect to either projects or processes." By this definition, applied research in industry differs from basic research chiefly in terms of objectives of the reporting company.

Development. The NSF survey concept of development may be summarized as ". . . the systematic use of scientific knowledge directed toward the production of useful materials, devices, systems or methods, including design and development of prototypes and processes."

Funds used for research and development refer to current operating costs, consisting of both direct and indirect costs including depreciation, insofar as this information is available to respondents. Capital expenditures are excluded by definition in both the industry and the other nonprofit sectors. Under the accounting practices of some Federal agencies, particularly the Department of Defense, data on the Federal R\&D funds, which are available in detail only in terms of obligations rather than expenditures, do not include an allowance for depreciation but do include some obligations for capital items. A small amount of capital outlays is also included in the universities and colleges sector.

The National Science Foundation surveys include data on research and development by Federally Funded Research and Development Centers (FFRDC's). These are laboratories or similar research undertakings supported wholly or predominantly by the Federal Government but operated under contract by an industrial, university, or independent organization. Data relating to the performance of research and development at these centers are included within the appropriate sector in the estimates for 1956 and later years.

Several groups of organizations comprise the industry sector as represented in table I. Private industrial firms account for over 95 percent of the total funds for performance of research and development
in this sector. (Data for firms appear in series W 144-160.) The remaining groups are FFRDC's operated by industrial concerns, independent commercial laboratories, and engineering service firms.
The colleges and universities sector consists of institutions of higher education with substantial research programs and of the FFRDC's operated under contract by educational institutions. Included in institutions of higher education are their affiliated research organizations, agricultural research centers, graduate and professional schools, and affiliated hospitals.
Other nonprofit institutions include privately endowed philanthropic foundations, nonprofit research institutes, voluntary health agencies, academies of science, professional societies, museums, zoological gardens, and arboretums, as well as several FFRDC's operated by independent organizations.
The data on transfers of funds were based on estimates from many institutions having somewhat different understandings of costs and expenditures. The estimates for Federal agencies, moreover, were based on obligations rather than expenditures, since information on transfers to the other sectors was available only for obligations. (Additional details appear in series W 126-143.)

For detailed information and trend data on R\&D funds and scientific personnel, see the following publications: National Patterns of $R \& D$ Resources, Funds and Manpower in the United States (annual); Federal Funds for Research, Development, and Other Scientific Activities (annual); Research and Development in Industry (annual); Scientific Activities at Universities and Colleges (biennial); Scientific Activities of Nonproft Institutions (periodic); American Science Manpower (biennial); Scientific, Technical, and Health Personnel in the Federal Government (annual); and Employment of Scientists and Engineers in the United States, 1950-66.

Early major efforts to estimate the volume of research and development. The methodology, scope, and limitations of the various series are often summarized in the publications cited below, and any use of these estimates in descriptive or analytical work should be preceded by a careful review of their limitations. Differences in concepts and scope of these earlier series make comparisons with the later NSF data not generally possible.

George Perazich and Philip M. Field, Industrial Research and Changing Technology, Work Projects Administration, National Research Project, Philadelphia, 1940, pp. 5-17 and 52-79. This report presents data on research personnel in industrial laboratories for $1920,1921,1927,1931,1933$, and 1938. The data are based on the six directory listings on industrial research laboratories in the United States published by the National Research Council between 1920 and 1938.

National Resources Committee (later, National Resources Planning Board), Research, A National Resource, vol. 1, Relation of the Federal Government to Research, Report of the National Resources Planning Board Science Committee, 1938. Section 3, pp. 61-112, of this report presents estimates of Federal expenditures for research in 1937 and 1938. Table D, p. 91, summarizes from other sources a number of earlier estimates of Federal expenditures going back as far as 1901. Section 6, pp. 167-193, contains a discussion of research in American universities and colleges. It also provides a general estimate of the dollar volume of expenditures for research and development for 1935-1936.

National Resources Planning Board, Research, A National Resource, vol. II, Industrial Research, a report of the National Research Council to the National Resources Planning Board, 1941. Section IV, pp. 173-187 of this report, presents estimates of research personnel in industrial laboratories for 1940; and section II, part 7, pp. 120-123, shows research personnel and expenditures in 31 firms for 1937.
U.S. Senate, Committee on Military Affairs, Subcommittee on War Mobilization (Harley M. Kilgore, Chairman), Report on the Government's Wartime Research and Development, 1940-44, 1945. Part I of this report presents detail, and part II summarizes data on funds for research and development for each of 45 Federal agencies
and bureaus, with detail on the fiscal sources of funds and the major categories of recipients for fiscal years 1940 through 1944.
Vannevar Bush, Science, The Endless Frontier, A Report to the President, July 1945, appendix 3, "Report of the Committee on Science and Public Welfare" (Isaiah Bowman, Chairman). The Bowman Committee's report to Dr. Bush presents the first known national estimates of trends in scientific research and development expenditures in table $I$, p. 80 . It also contains series on scientific research expenditures (based largely on performance of research) for the following major groups: (a) Industry-annual expenditures estimates for 1920-1940; (b) nonprofit industrial research institutesannual expenditures estimates for 1930-1942; (c) Government (Federal and State)-annual estimates for 1923-1932, 1934-1938, and 1940-1944; (d) colleges and universities-biennial estimates, 1930, 1932, 1934, 1936, 1938, 1940, and 1942; (e) research institutes (not connected with any industry nor an integral part of any uni-versity)-annual estimates for 1930-1940; and ( $f$ ) total scientific research expenditures-total of the foregoing five series for 1930,1932 , 1934, 1936, 1938, and 1940.

The President's Scientific Research Board (John R. Steelman, Chairman), Science and Public Policy, A Report to the President, vols. I, II, and IV, 1947. Based on data in Vannevar Bush, Science, The Endless Frontier (cited above, vol. I, A Program for the Nation, presents for the even years of 1930-1940 estimated expenditures by the Federal Government, industry, universities, and others. Estimates are also made of the average annual expenditures by major groups for 1941-1945 and of expenditures for 1947. Vol. II, The Federal Research Program, presents estimates of Federal "expenditures for research and development in the physical and biological sciences" in fiscal year 1947 based on project reports from the individual agencies. Vol. IV, Manpower for Research, presents annual estimates and forecasts of scientists and engineers in industrial research laboratories for 1929-1956.

Helen Wood, Robert Cain, and Joseph H. Schuster, Scientific Research and Development in American Industry, A Study of Manpower and Costs, Bulletin No. 1148, U.S. Bureau of Labor Statistics, prepared in cooperation with the Department of Defense, 1953. Data in this publication are based on the first survey specifically designed to obtain research and development performance costs and personnel for private firms. The report presents estimates of expenditures for research and development performed in 1951 by firms reporting. Personnel data cover research and development scientists and engineers employed by these firms in January 1951 and 1952.

Office of the Secretary of Defense, The Growth of Scientific Research and Development, 1953. This publication presents annual estimates on sources of research and development funds and on performance of research and development for 1941-1952 for the Federal Government, industry, and nonprofit in'stitutions including colleges and universities. Estimates of the number of scientists and engineers employed in research and development by these broad sectors are also shown for the same years. No methodological notes accompany the estimates. They are known to be based on materials in Wood, Cain, and Schuster (cited above); U.S. Senate Committee on Military Affairs, Subcommittee on War Mobilization (cited above); and other published and unpublished sources.

Office of Education, Statistics of Higher Education; Receipts, Expenditures, and Property, 1953-54,1957. This report presents biennial estimates on expenditures for performance of "Organized research" by institutions of higher education, 1930-1954. See series H 732 in this volume. This is the oldest known current series on research expenditures.

More recently, beginning with Bureau of the Budget, The Budget of the United States Government, 1955, the Federal budget documents have carried a special analysis of "Federal Research and Development Programs' summarizing expenditures and/or obligations for research and development and R\&D plant on an agency basis. In The Budget, 1972, this was Special Analysis R and covered fiscal years 1970, 1971, and 1972.

W 109-125. Funds expended for performance of research and development and basic research, by sector, and major function, 1953-1970.

Source: U.S. National Science Foundation, National Patterns of $R \& D$ Resources, 1953-72, Funds and Manpower in the United States (NSF 72-300).

The four-sector division followed by the National Science Foundation attempts to take account of both the legal nature and major functions of organizations active in financing and performing basic research, applied research, and development. However, grouping diverse types of organizations into discrete sectors requires certain arbitrary judgments because of the mixed nature of many organizations, particularly those in the university and other nonprofit sectors.

The Federal sector is made up of the agencies of the Federal Government.

The industry sector consists of both manufacturing and nonmanufacturing companies. Manufacturing is surveyed in major industry groupings; and nonmanufacturing, which includes organizations such as those in selected service industries, is treated as a unit. Federally Funded Research and Development Centers (FFRDC's) administered by industrial firms are also included.
The universities and colleges sector is composed of all institutions of higher education, both public and private. The term "universities and colleges" is used to refer to the academic institutions as a group without the associated FFRDC's administered by the schools for various Federal agencies. The universities and colleges comprise the following:

Colleges of liberal arts; schools of arts and sciences; professional schools, such as engineering and medical schools, including affiliated hospitals; associated research institutions, and similar organizations, which are integral parts of the universities and colleges; agricultural experiment stations and associated schools of agriculture.
Funds used at the universities and attributed to the universities sector as a source consist of: (a) State and local government funds separately budgeted for research and development, (b) the direct or indirect costs of R\&D performance sponsored by outside organizations that were defrayed in part by universities and colleges in accordance with cost sharing or other arrangements, and (c) unrestricted or general funds which the institutions themselves have been free to allocate for research either through their instructional or departmental budget or through their own separately budgeted research. Funds from the Federal Government, industry, or other nonprofit institutions, which are supplied in the form of grants or contracts for research or development at a university, are credited to the appropriate source in the performance of research and development by universities and colleges. Thus, research contracts from industry are treated as university performance funded by industry as the source, whereas funds given to the institution by industry for general educational purposes and used by the school, at its discretion, for research, are treated as university performance financed with the university's own funds.

Institutions in the other nonprofit sector fall into two general groups: (1) Organizations that are primarily granting in nature, namely private philanthropic foundations and voluntary health agencies, and (2) public and private organizations that are primarily involved in performing research and development, comprising separately incorporated nonprofit research institutes, professional societies, academies of science, museums, zoological gardens, botanical gardens, arboretums, nonprofit hospitals, and FFRDC's administered by nonprofit organizations.

In these series, both the university and the other nonprofit sectors contain private and public institutions-the latter either closely associated with or considered a part of State or local government. A number of organizations in both sectors, as well as in industry, also receive State and local government funds.

In the Foundation's surveys, respondents in all four sectors indicate the amounts they spend on research and development in their own sector and the sources of these funds. The National Science Foundation bases all national totals on data as reported by performers because institutions doing research and development are in the best position to: (a) indicate how much they spent in the actual conduct of research and development in a given year, (b) classify their work as basic, applied, etc. and (c) identify the sector of the economy in which their financing originated. The use of performer reporting throughout also reduces the possibility of double counting. Because the national time series on Federal funds spent in research and development are based on expenditures reported by organizations which have actually performed the research and development, they differ from the series in Federal Funds for Research, Development, and Other Scientific Activities on agency obligations for research and development to be performed in the non-Federal sectors. Federal agency obligations are used in the series only for intramural performance in agency laboratories where they are treated as the equivalent of expenditures. Expenses of Federal personnel engaged in planning and administering intramural and extramural $R \& D$ programs are also included in the intramural performance total.

W 126-143. Federal funds for research and development, by agency, 1947-1970.

Source: 1947-1951, U.S. Bureau of the Budget (now the Office of Management and Budget), unpublished data; 1952-1970, U.S. National Science Foundation, Federal Funds for Research, Development, and Other Scientific Activities, Vol. XXI.

Obligations represent orders placed, contracts awarded, services received, and similar transactions during a given period, regardless of when the funds were appropriated and when future payment of money is required. One of the limitations of these data is that they are two series compiled at different times and on somewhat different bases. The first series, FY 1947-51, was compiled by the Bureau of the Budget. The second series, FY 1952-70, is based on agency submissions to the National Science Foundation for its annual survey on Federal Funds for Research, Development, and Other Scientific Activities. Since Government accounting does not use research and development as a uniform bookkeeping category for all agencies, the data represent estimates by informed persons.
Expenditures represent checks issued and cash payments made during a given period, regardless of when the funds were appropriated.
For agencies operating on a cost-type budget, accrued expenditures and costs are reported instead of obligations. Accrued expenditures represent all costs accrued during the reporting period except those subject to reimbursement from other agencies.

The obligations and expenditures reported cover all transactions from all funds available from direct appropriations, trust funds or special account receipts, corporate income, or other sources, including funds appropriated to the President that an agency received or expects to receive. The amounts reported for each year reflect obligations and expenditures for that year regardless of when the funds were originally authorized or received and regardless of whether they were appropriated, received, or identified specifically for research, development, or R\&D plant.

Funds reported for research and development reflect full costs. In addition to costs of specific R\&D projects, the applicable overhead costs are also included. The amounts reported include the costs of planning and administering R\&D programs, laboratory overhead, pay of military personnel, and departmental administration.

R\&D plant (or R\&D facilities and fixed equipment, such as reactors, wind tunnels, and radio telescopes) includes acquisition of, construction of, major repairs to, or alterations in structures, works, equipment, facilities, or land, for use in R\&D activities at Federal or non-Federal installations. Excluded from the R\&D plant category are expendable equipment and office furniture and equipment. Obli-
gations for foreign R\&D plant are limited to Federal funds for facilities located abroad and used in support of foreign research and development.

W 144-160. Funds for industrial research and development, by industry, 1956-1970.
Source: U.S. National Science Foundation, Research and Development in Industry, annual reports.

The report covering R\&D expenditures for 1956 and 1957 follows the general format used in subsequent annual reports. The National Science Foundation also sponsored two industry surveys covering the 1953-56 period, which were conducted by the U.S. Bureau of Labor Statistics (BLS): Science and Engineering in American Industry, Final Report on a 1953-54 Survey (NSF 56-16) and Science and Engineering in American Industry, 1956 (NSF 59-50). Data obtained in the BLS surveys are not directly comparable with U.S. Bureau of the Census figures for 1957-70 because of methodological and other differences in the surveys conducted by the two agencies and have, therefore, been excluded. In addition, the Census surveys, beginning in 1957, have collected data on the R\&D activities of Federally Funded Research and Development Centers (FFRDC's) operated by business firms, whereas the earlier BLS surveys did not. To account for the R\&D performance of these research centers in 1956, Census adjusted data for that year (collected in the 1957 survey) to provide comparable trend data from 1956 forward.
The surveys in this series have made use of the "shuttle" type questionnaire, permitting respondents to report information for the current year and at the same time make revisions as necessary in figures for the preceding year, which were preentered by the Bureau of the Census.
Research and development as defined in these series, includes basic and applied research in the physical and life sciences (including medicine) and in engineering, and design and development of prototypes and processes. This definition excludes quality control, routine product testing, market exploration, research in the social sciences or psychology, or other nontechnological activities or technical services.
Expenditures, as defined in these series, include salaries of research and development scientists and engineers and their supporting personnel, other direct costs, service and supporting costs, plus attributable overhead expenses incurred in such items as administration, depreciation, and rent. Expenditures also include Federal funds for private industry performance of research and development ranging from about 40 percent of total expenditures in 1953 to about 50 percent in 1970. The totals exclude capital expenditures and patent expenses.

The industry surveys conducted by the Bureau of the Census for the National Science Foundation use the company as the reporting unit. The company is defined as a corporate entity that includes all establishments under common ownership or control. Each company is classified in a single industry on the basis of its primary business activity, although many companies engage in research and development and productive activities outside the industry in which they are classified. Since many firms are active in several diverse product fields, data collected in this survey are not comparable with figures reported elsewhere on an establishment basis.

For the period 1963-70, companies in the survey have been assigned an industry classification based on the 1963 economic censuses conducted by the Bureau of the Census. Similarly, figures for 1958 and earlier years are based on the company classifications resulting from the 1958 economic censuses. To provide a continuous time series, individual industry data for 1959-1962 (previously classified on the 1958 basis) have been adjusted to account for the differences in absolute level resulting from the two classifications. A detailed explanation of the adjustment technique is contained in the Technical Notes section of the industry reports.

W 161-167. Funds for industrial research and development, by character of work, and cost per scientist or engineer, 1953-1970.

Source: U.S. National Science Foundation, series W 161-165 and W 167, Research and Development in Industry, 1970 (NSF 72-309) pp. 68 and 83 ; series W 166, unpublished data.

For series W 161-165, see the general note for series W 109-180.
W 166, R\&D scientists and engineers. Those engaged full time in research and development and the full-time equivalent (FTE) of those working part time. Scientists and engineers are defined as persons engaged in scientific or engineering work at a level which requires a knowledge of physical, life, engineering, or mathematical sciences equivalent at least to that acquired through completion of a 4-year college course with a major in one of those fields.

W 167, cost per R\&D scientist or engineer. The number of R\&D scientists and engineers used to estimate the cost per R\&D scientist or engineer for 1967-70 is the number of man-years; between 1957 and 1966 , the arithmetic means of the numbers of R\&D scientists and engineers reported in each industry for January in two consecutive years was used.

W 168-180. Employment of natural scientists and engineers, 19501970.

Source: U.S. Bureau of Labor Statistics, unpublished data.
Scientists and engineers in these data include those who "work as" natural scientists or engineers. This concept, therefore, includes persons without college degrees in science and engineering who were working in engineering and science jobs. It does not include individuals with college degrees in science and engineering who are not working in these fields. Also excluded are social scientists and high school teachers of science subjects, as well as medical scientists who spend the greatest portion of their time providing care to patients.

The basic definitions used in these series are those used in the periodic surveys of scientific and technical personnel in private industry and in State and local governments, conducted by the Bureau of Labor Statistics (BLS). These surveys cover about four-fifths of all scientists and engineers. Following are definitions used in these surveys: (1) Scientists and engineers are workers who perform
at a level requiring education or training equivalent to that acquired through completion of a 4 -year college course with a major in a natural scientific or engineering field; (2) $R \& D$ scientists and engineers are defined as those who spend the greater portion of their time in basic and applied research in the natural sciences (including medical science) and engineering, and in design and development of prototypes and processes; (3) Employment data include all workers employed as scientists and engineers whether full or part time.
Annual estimates refer to January or "early-in-year" employment. Adjustments were necessary to survey data on Federal Government and local governments, as October was generally the date of the surveys in these sectors.
Historically, surveys of science and engineering employment have been made separately for six major sectors of the economy-private industry, Federal Government, State governments, local governments, universities and colleges, and nonprofit organizations. In private industry, surveys of scientific and technical personnel were conducted by BLS for the years 1952, 1954, annually 1959 through 1964, 1966, 1968, and 1969. Data on State government employment, also collected by BLS, are available only for the years 1959,1962 , and 1964. Other nonrecurring BLS surveys in this field include a survey of science and engineering employment in local governments for the year 1963 and a pilot survey covering such employment in six States in 1960. Surveys of science and engineering employment in universities and colleges were conducted by the National Science Foundation in 1954, 1958, 1961, 1965, 1967, and 1969. Scientists and engineers employed by nonprofit organizations were surveyed by BLS in 1958 and the NSF in 1965 and 1967. An NSF survey in 1960 of such employment was limited in scope.

Other sources of information used included BLS establishment data on total wage and salary worker employment and production worker employment; information from the Decennial Census of Population, 1950 and 1960; Bureau of the Census, Current Population Surveys; information on R\&D expenditures from the NSF and Department of Defense; information from the NSF's National Register of Scientific and Technical Personnel on scientists, by field, type of employer, and function; and data on full time equivalent R\&D employment of scientists and engineers in private industry from NSF reports.

For 1957-69, the number of $R \& D$ scientists and engineers was derived by using hearithmetic mean of the full-time-equivalent number of $R \& D$ scientists and engineers employed in January of two consecutive years; for 1970 , man-years were used.

# Financial Markets and Institutions 

Flow of Funds (Series X 1-392)

## X 1-392. General note.

These data present an integrated picture of financial claims outstanding in the U.S. economy. They summarize the types of claims, who owes them as liabilities, who holds them as assets, and, for some major groups in the economy, how lending and borrowing are related to income and expenditure flows. The data are based on a wide range of information from public and private statistical sources. Directly or indirectly they reflect banking statistics, Treasury accounts, Census data, tax return compilations, balance of payments statements, security market data, and balance sheet tabulations for several kinds of nonbank financial institutions. Data from these diverse sources have been adjusted in many ways to make them consistent with one another in coverage and in definition of types of claim. The process of adjusting them into consistency produces a total system of financial accounts for the economy that includes separate statements of financial position and of transactions for each major institutional group in the system. As a whole, this financial accounting structure constitutes the flow-of-funds system of accounts published by the Federal Reserve System.
Broadly grouped, this section has three parts: (1) a summary of total debt and the structure of assets that finances that debt; (2) statements for households, business, and State and local governments on their saving and investment and financial positions; and (3) summaries for major financial markets of lending and borrowing positions.
Some of the tables include data on both amounts of claims outstanding at year-ends and net flows during years. For most financial claims, the net flows are the changes over years in outstandings and represent the excess of new claims created or acquired during the year over repayments or other disposition. There are exceptions, however, notably in equities in corporate and noncorporate business. Capital supplied to business through corporate stock issues or through proprietors' equity investment appears in the flows as external sources of funds to business and as uses of funds by investors; as equity positions such funds are not included in business liabilities in the tables on outstandings. Corporate equity assets are shown at market value based on prices on stock exchanges, while noncorporate equities are omitted for lack of information on values. Changes in market prices cause the aggregate market value of corporate equities to fluctuate far more from year to year than would be accounted for by net purchases, and the difference is capital gains and losses, mainly unrealized, that are not included in the tables on net flows. For equity markets, therefore, the tables on outstandings and on flows reflect separate aspects of developments.
Tables on flows for households, business, and governments are broader than the tables on outstandings in that they are full statements of saving and investment for the groups covered, including income, spending, and physical asset purchases as well as lending and borrowing. The data on saving and tangible investment for these groups are taken directly from national income accounts, which are summarized in chapter $F$. The relation between the amounts shown here and national income datia are described in the November 1965 Federal Reserve Bulletin, pages 1534-1538. For each of these groups, saving and investment are defined to be equal although measured differently, with saving the excess of current receipts over current outlays and investment the sum of outlays for tangibles and financial assets less net borrowing. Because saving and investment
are calculated from separate bodies of data, there are inevitable discrepancies between the two that are also shown in the tables.
The tables of net flows for these three groups relate in outstandings to complete balance sheets that include physical assets and net worth as well as the financial assets and liabilities that are included in the tables on outstandings. Changes in net worth in such balance sheets would equal saving (as shown in the flow tables), plus capital gains, while changes in assets less liabilities would equal net investment flows plus the same capital gains.

Complete balance sheets consistent with saving and investment flows are being developed on an economy-wide basis but (as of July 1975) are not in a form that can be included here. These balance sheets require estimates of tangible asset holdings on a uniform valuation basis, with totals for all groups in the economy that are consistent with tangible asset totals of the kind shown in chapter F. Until these estimates are completed only partial balance sheets can be shown, covering financial assets, liabilities, and a net difference that is the financial net worth of each group. When tangible asset holdinys can be added to these financial net worth figures, it will be possible to cumulate wealth estimates for individual groups into national wealth totals that are consistent with those shown in chapter $F$. Most of the financial claims included are both held and owed within the national economy and are canceled out in national wealth cumulations, but they are major elements in the distribution of wealth ownership. At the same time their net sum-the excess of U.S. claims on foreigners over foreign claims on the U.S.-represents the financial component of total national wealth.

The primary interest in these tables on financial claims, however, lies not in their relation to national wealth estimates but rather in the picture of financial structure that they give, the indications of debt burden, liquidity positions, structure of intermediation, and surplus-deficit positions that can be derived from them. While most of the debt is not part of national wealth, the structure of debtlong term or short term-and who owes it-government, business, or households-have important bearings on private spending decisions. The forms of private financial assets-deposits, long-term securities, and so forth-have influences on credit availability as well as on spending. The tables on outstandings are intended to indicate these aspects of financial structure, while the tables on flows give the relation of financial market transactions to nonfinancial activity that generates both the saving from which credit is supplied and the spending for which credit is demanded.

As a group the tables are selective in several ways, since there is not space to include a total statement of all financial activity. Thus, the three summary tables (series X 1-113) encompass all sectors of the economy but are limited primarily to their credit market activities. The tables on individual sectors (series X 114-262) cover all transactions and financial positions of the groups that have been included but represent only the private nonfinancial economy. The principal omissions are banks and other financial institutions, the Federal Government, and foreign transactors. These are covered in some what different form in other sections of this volume. The tables on individual financial markets (series X 263-392) are also selective in that they cover all flows into and out of major markets covered but do not include all financial markets. In this area the most important omission is bank loans, which again is covered elsewhere.

Other omissions consist of security credit, commercial paper, and a variety of other credit forms that are relatively small.

## X 1-113. General note.

These series are a summary of total credit in the economy and its sources. The forms of credit included are indicated in series X 1-23. Other kinds of financial obligation that are not directly part of credit markets are omitted. Most of these other obligations are represented in series X 114-262.

## X 1-23. Debt of nonfinancial borrowers, 1945-1970.

Source: Board of Governors of the Federal Reserve System, Flow of Funds Accounts: Financial Assets and Liabilities Outstanding, 1945-1971, and unpublished data.

This set of financial claims, owed by governments, househoids, nonfinancial business, and foreigners, is an approximation to a base amount of total credit that is used to finance nonfinancial activity in the economy, such as public deficits, business capital formation and inventories, home building, and consumer durables purchases. Government debt omits most public intermediation in financial markets, such as in federally sponsored credit agencies, and the private borrowing omits security credit, book trade accounts, direct foreign investment, other more informal types of financial relationship, and all liabilities of financial intermediaries. For private borrowers the flow of credit included is related closely in total to the volume of capital expenditures, with variations in the relationship and in forms of debt that reflect changing credit conditions.
U.S. Government debt shown is essentially the total for net public borrowing in unified budget presentations. It excludes intragovernment holdings that are part of the larger total of public debt subject to statutory limitation. The unified budget has been published by the Treasury only from the beginning of 1969, but the figures for earlier years have been adjusted to that basis for consistency over time. The figures include Treasury securities, issues by other budget agencies, loan participation certificates, mortgage debt, and Commodity Credit Corporation (CCC) certificates of interest.
State and local government debt is derived from the census of governments.

Corporate and foreign securities are based on Securities and Exchange Commission data on net change in outstandings; the totals for outstandings are Federal Reserve estimates. The figures exclude all issues by financial institutions, and exclude liability for corporate equities outstanding.

Mortgage totals are as published by the Federal Reserve except that they exclude loans in process of disbursement and Federal Government debt in mortgage form.
Bank loans are from banking statistics and are essentially total business loans, farm loans, and loans to individuals after removing credit in the form of open-market paper, CCC-guaranteed loans, consumer credit, and security credit. Loans to financial business are omitted. Consumer credit is as published by the Federal Reserve. Open-market paper consists of dealer-placed commercial paper issued by nonfinancial corporations and bankers' acceptances. Other loans consist mainly of business credit from finance companies and loans by the U.S. Government and federally sponsored credit agencies to business, households, and foreigners. They include foreign loans in aid programs and Export-Import Bank credit.

## X 24-63. Funds raised in credit markets by nonfinancial sectors, 1946-1970.

Source: Board of Governors of the Federal Reserve System, Flow of Funds Accounts: Annual Flows, 1946-1971, and unpublished data.

See text for series X 1-23.

X 64-113. Sources of credit market funds, 1945-1970.
Source: See source for series X 1-23.
These series distribute, as assets in the economy, the credit totals that appear in series X 1-23 as liabilities, indicating at the same time the position of financial intermediaries and governmental credit agencies in the structure of supply. The series are divided into three sections-credit from public agencies and foreign investors, assets and liabilities of private intermediaries, and assets of private domestic nonfinancial groups. Public agency credit includes-in addition to direct lending by Federal Government agencies-Federal Reserve credit related to money supply and bank reserves, loans by federally sponsored credit agencies, and foreign holdings of credit market instruments. The sponsored credit agencies (series X 71) are a group of institutions that at some time before 1970 had been part of or partly owned by the Federal Government or other sponsored agencies: Federal National Mortgage Association, Federal Home Loan Mortgage Corporation, Federal home loan banks, Federal intermediate credit banks, banks for cooperatives, and Federal land banks. The sponsored agency figures also include mortgage pools backing securities guaranteed by the Government National Mortgage Association. Lending by the sponsored agencies is financed mainly by issues of their own securities to private investors, and in series X 74 these agency issues are brought into total credit holdings of private domestic lenders, shown in series X 75, and private holdings of Government securities, in series X 76. Some of these agency issues finance loans to financial intermediaries (series X 68) that are not part of the debt of nonfinancial sectors (series X 64) and such loans (series $X$ 81) are excluded from net private holdings (series X 75). Foreign holdings (series X 73) are mainly official, such as at central banks, in recent years.

Private domestic holdings of credit instruments are partly in the portfolios of intermediaries (series X 82 ), and the volume of intermediation is a strong influence on the forms of credit supply. Intermediaries held far more, proportionately, in direct loans to business and housing than nonfinancial investors, whose portfolios of direct credit instruments consist mainly of securities issued in public markets. Hence a period of large credit flows through intermediaries is typically also a period when loan volume is large compared with net new security issues. Intermediary credit supply is heavily dependent on domestic deposit flows to banks and savings institutions, although these institutions also borrow directly in credit markets or from foreign sources to some extent. The relative importance of sources of intermediary funds is indicated in series X 87-93.

Direct lending in credit markets from nonfinancial groups in the private economy (series X 94) exhausts the total of credit outstanding, where, at this level, the total includes borrowing by public credit agencies (series X 74) and private intermediaries (series X 88) as well as nonfinancial sectors (series X 64). For these nonfinancial investors, credit instruments are part of a portfolio that includes deposits at intermediaries that appear earlier as sources of intermediary lending (series X 87). As private assets the deposits are shown beyond credit instrument holdings, together with currency claims on the Federal Reserve. A total portfolio of securities and deposits (series $X$ 105) for private domestic nonfinancial investors appears at the end of this set of assets.

Corporate equity markets (series X 109-113) are excluded entirely from the preceding series on credit market instruments. Holding of equities are stated at year-end market values, and movements in holdings reflect to a large extent capital gains and losses, whether realized or unrealized, that result from market price movements.

## $X$ 114-262. General note.

These series present full financial statements for three major groups in the economy-households, business, and State and local governments. They include a variety of obligations that are not directly in the credit markets summarized in the preceding series, such as insurance claims and taxes payable.

## X 114-191. General note.

These series consolidate trusts and nonprofit organizations with households mainly because data for a separation of the three groups have been lacking until recent years. From available information, trusts and nonprofit groups appear to hold less than 10 percent of the assets shown in series X 114-147, and their debts are mainly in nonresidential mortgages (series X 140). Apart from these institutional investors, the financial positions shown by series X 114-147 are aggregates for individuals as personal investors and borrowers.
These series omit assets and liabilities connected with noncorporate business, such as trade receivables, commercial and farm mortgages, and business loans from banks; noncorporate business finances are included in series X 192-228. In this respect, the household series shown here differ in coverage from those on individual savings (series F 566-594), which include noncorporate business.

The data for household saving and investment (series X 148-191) include as one item a net flow of equity funds from noncorporate proprietors as households into the business sector, but the assets and liabilities data (series X 114-147) exclude such equities because information is lacking on the value of physical assets of noncorporate business.
Apart from noncorporate equities, the assets and liabilities data give the financial asset and debt positions of households resulting from the investment flows shown by the saving and investment series.

X 114-147. Financial assets and liabilities of households, personal trusts, and nonprofit organizations, 1945-1970.

Source: See source for series X 1-23.
The total shown here for deposits and credit market instruments (series X 115) represents the household component of financial assets (series X 105) in the preceding sources of credit table. Other financial assets consist mainly of corporate equities and claims on life insurance and pension funds.

The credit market instruments liability (series X 138), comprising mainly home mortgages and consumer credit, represents the household component of debt (series X 19) shown in the summary credit table. Other liabilities are related mainly to borrowing for purchasing or carrying securities.

X 148-191. Saving and investment of households, personal trusts, and nonprofit organizations, 1946-1970.

Source: See source for series X 24-63.
Lending less borrowing in series X 114-147 is a measure of the net credit flow from households to other sectors through credit markets. Households are characteristically large net lenders to business and governments, either directly or through intermediaries (series X 165). This net lending is combined with purchases of houses, consumer durables, and nonprofit plant and equipment to give a total investment flow (series X 159) that is, by definition, equal to household saving out of current income (series X 158). Saving and investment are measured from different data sources, however, and a statistical discrepancy exists between them that is shown in series X 191. Series X 148-158 show the relation between personal saving in the national income accounts and gross saving as defined in these tables. The principal adjustments serve to capitalize outlays on consumer durables and growth of claims on government life insurance and employee retirement funds.

## X 192-228. General note.

These series cover both corporate and noncorporate business, including farming. Financial sources of funds include net new share issues by corporations as well as net increases in debt claims outstanding. As equities, the share issues are excluded from the liabilities items (series X 199-206).

X 192-206. Financial assets and liabilities of nonfinancial business, 1945-1970.
Source: See source for series X 1-23.
Business financial assets (series X 192-197) are mainly liquidity balances-deposits and credit market instruments-and trade credit. Series X 193-195 are the business element of sources of funds to credit markets in series X 105. Trade credit (series X 196) is almost entirely held by and owed by business and is excluded from the credit market totals in data for debt of nonfinancial borrowers (series X 1-23) and for sources of credit market funds (series X 64-113). The largest component of miscellaneous assets (series X 197) is the direct investment position of corporations in foreign subsidiaries and branches,
Credit market debt (series X 199) is identical to series X 20. As mentioned above, most business trade debt is owed within the group to other firms. "Other" liabilities (series X 206) consist mainly of current accruals such as profit taxes accrued but not yet due.

## X 207-228. Saving and investment of nonfinancial business, 19461970.

Source: See source for series X 24-63.
Total in come before taxes (series X 207) is taken directly from the national income accounts (NIA) and consists of corporate profits and inventory valuation adjustment, proprietors' income from noncorporate business, and part of rental income of persons. Series X 207 excludes rental income that is imputed in national income accounts to owner-occupied houses. That income and all other flows associated with owner-occupied houses are included in the data for households (series X 114-191).

Business gross saving (series X 208) is mainly depreciation charges and other capital consumption allowances that are not cash outlays, but it also includes corporate retained profits after profit taxes and dividends. Noncorporate income is treated as though paid over entirely to proprietors in the household group, and no element of noncorporate retained income is included in the gross savings total. Capital expenditures (series X 211-215) are also from rational income accounts (NIA) although not published in the NIA for exactly this group. Expenditures exclude purchases of houses by households, and plant and equipment outlays by nonprofit organizations and by financial business.
In almost all of the years since World War II business capital outlays have been somewhat larger than business gross saving (internal cash flow), and funds raised externally (series X 218) have been correspondingly higher than financial uses of funds (series X 217).

Series X 228 is a statistical discrepancy, the excess of gross saving over an independently measured gross investment total. An important source of this discrepancy is net land purchases, for which estimates are not yet available. These purchases are probably mainly from households and are offset by an equal and opposite element of the household discrepancy, series X 191 (see above).

## X 229-262. General note.

Gross saving of State and local governments in series X 247 is the net surplus published in national income accounts less a retirement credit to households that removes employee retirement funds from this group. The retirement funds are viewed here as a form of financial institution parallel to private pension funds, and the data for State and local governments exclude their assets and activities. The basic source of information for these series is the annual surveys of governmental finances published by the Bureau of the Census. Census data are converted from a presumed mid-year fiscal basis to calendar-year estimates on the basis of quarterly data from other sources. Certain adjustments are included which integrate the financial data with national income definitions of the group and its nonfinancial transactions.

Credit market supply of funds by State and local governments included in series X 105 consists of data shown in series X 230-232. Credit market debt (series X 239) is identical with series X 18.

X 229-244. Financial assets and liabilities of State and local governments, 1945-1970.

Source: See source for series X 1-23.
See general note for series X 229-262.
X 245-262. Saving and investment of State and local governments, 1946-1970.

Source: See source for series X 24-63.
See general note for series X 229-262.

## X 263-392. General note.

These financial market data series cut across a different dimension of the economy's financial structure from the preceding series. The former are statements for selected institutional groups of transactions and balance sheet positions that relate to the nonfinancial activities of these groups. The market data series, on the other hand, beginning with series X 263-275, for example, indicate for selected types of financial instruments the institutional groups that acquired the claims as assets and that issued them as liabilities. Certain items, however, from the preceding series are repeated here. Corporate bonds held by households, for example, shown in series X 128 as a form of household asset, is shown in series X 345 as one of a set of group holdings of corporate bonds that together account for all of the bonds outstanding. Except in corporate equities, the financial market series present only assets and liabilities outstanding, and net flows to or from the markets can be closely deduced from yearly changes in outstandings. Corporate equities are a special case where changes in market values cause movements in values of holdings that are very different from net transactions. Both value of holdings and net flows are shown for equities.

## X 263-275. Money supply, 1945-1970.

## Source: See source for series X 1-23.

Demand deposits and currency are the principal means of payment in the U.S., and the amounts held outside banks and the U.S. Government constitute the narrowly defined money supply. These data show the ownership distribution of the money supply and the banking system liability for money and Government cash balances. The figures conform to the definition of money stock as published weekly by the Federal Reserve System, but they are for a single day of the year, December 31, rather than period averages. Series X 265-267, holdings by households, business, and State and local governments are repeated here for series X 116, X 193, and X 230, respectively. Money stock is also held by nonbank financial institutions and by foreigners. These holdings are presented as they appear on the balance sheets of the holder groups. A further element of money supply, shown here as "mail float" (series X 270), is not in the balance sheets of any holders. This float is made up of checks that have been deducted from the books of the check writers but are not yet included in the books of receivers. This is a float in addition to cash items in process of collection and Federal Reserve float, both of which have been deducted already in calculating total money supply. In addition to the money supply, the series presented also include U.S. Government cash balances (series X 271), which are mainly Treasury deposits, and include, in addition, cash and currency held by other agencies.
Liability for cash balances lies partly with the Federal Reserve and certain Treasury accounts, grouped together as "monetary authorities" (series X 272) and partly with commercial banks. The monetary authorities component is mainly currency outside banks but also includes Treasury and foreign official deposits at Federal Reserve Banks and Treasury holdings of currency. The commercial bank liability consists of demand deposits held by nonbanks, after deducting cash items in process of collection and Federal Reserve float.

X 276-292. Time deposits and savings accounts, 1945-1970.
Source: See source for series X 1-23.
Commercial banking liability includes passbook savings deposits and several types of deposit with specific maturity dates. These are shown here as negotiable certificates of deposit (CD's) of $\$ 100,000$ denomination or more and all others (series X 278 and X 279). The series cover ownership distributions on total time deposits, but not on negotiable CD's separately. Sources for time deposit owner-ship-mainly bank financial reports and corporate business state-ments-are inadequate for a separate allocation of CD holdings.
Deposits at nonbank savings institutions are held predominantly by households. In recent years these institutions have also started issuing certificates with stated maturities.

## X 293-327. U.S. Government securities, 1945-1970.

Source: See source for series X 1-23.
The ownership estimates shown here cover all of the U.S. Government debt that appears in series X 2 except mortgages. In addition, they include the securities of federally sponsored credit agencies shown in series X 71 . The sponsored-agency issues are financial intermediation that is excluded from the debt totals shown in series X 1-23, but they are part of the market for public and agency securities presented here. The sponsored credit agencies are listed in the text for series X 64-113. Almost all of the issues included here, other than sponsored agency securities, are part of public debt subject to statutory limitation, but the totals shown exclude securities held within the Government, such as by social security and civil service retirement funds, and are therefore substantially less than the total debt under ceiling, which includes these intragovernment holdings. Short-term Treasury issues (series X 296) include all marketable securities due within one year of the date shown plus a sliding proportion of those due within two years, as calculated by the Federal Reserve. "Other" Treasury issues (series X 297) are all longer-term marketable securities plus nonmarketable securities other than savings bonds. Budget agency issues and loan participation certificates (series X 299 and X 300) are borrowings by agencies other than the Treasury that became part of net borrowing from the public when the unified form of budget was introduced in 1969. Agency issues are mainly Tennessee Valley Authority and Export-Import Bank securities, and loan participations are obligations of Export-Import Bank, Government National Mortgage Association (GNMA), and a number of other agencies. They include Commodity Credit Corporation certificates up to 1970. For 1970 they also include insured notes sold by Farmers Home Administration, a form of claim that is not included in public borrowing in budget documents. Included in the totals for sponsored-agency debt outstanding are mortgagebacked securities guaranteed by GNMA.

All of the securities are shown at par values, both as liabilities and as assets. The estimates are based primarily on the Treasury Ownership Surveys that are published monthly in the Treasury Bulletin. Although definitions of the Government and forms of budget reporting changed substantially from 1945 to 1970 the figures shown here are all on a single definitional basis consistent with budget coverage in 1971. Sponsored-agency debt, for example, includes for all years debt of institutions that were in the group in 1971, even though some or all of the agencies were in the budget in earlier years.

While intragovernmental holdings of debt are excluded, asset holdings include Government investment in sponsored-agency issues, sponsored-agency investment in Government issues, and Federal Reserve holdings of both Treasury and agency securities (series X 302-304). Foreign holdings (series $X$ 305) have in recent years been mainly in the hands of official institutions such as central banks.

The remaining asset holdings (series X 306) comprise the public debt held by private domestic investors and approximate the amount that must compete against other forms of credit for funds in the domestic market. Roughly one-quarter of this total is household savings bonds, Series E and H , shown on the debt side in series X 295.

Savings bonds were the major form of household Government securities for most of the period covered. For other domestic groups, holdings were predominantly marketable Treasury issues, although agency securities increased rapidly toward the end of the period. Household, business, and State and local government holdings (series X $310-312$ ) are duplicated here for series X 121, X 195, and X 233, and in total for series X 95 .

## X 328-378. Bonds and mortgages, 1945-1970.

Source: See source for series X 1-23.
These data present ownership of the principal forms of private long-term credit instruments, including State and local government securities. Holdings for all groups except households are based on balance sheet tabulations by Government agencies, trade associations, or private research organizations. Household assets are in each case calculated residually by subtracting holdings reported for other groups from the totals outstanding. This procedure puts a questionable valuation on household security assets. While most of the liability totals are stated at par values, the institutional holdings subtracted are book values which represent a mixture of par, cost, and amortized cost values. The resulting distortions in household asset values are probably not large but should be borne in mind.
The totals for debt outstanding come from a variety of sources. For State and local government securities they are taken from the annual surveys of governmental finances published by the Bureau of the Census, with adjustments to shift fiscal-year totals to a December 31 basis. Borrowings by State and local governments from the Federal Government (series X 338) are removed from the total as a separate form of debt. Totals for corporate bonds outstanding are essentially cumulations of net new issues published by the Securities and Exchange Commission, starting from a base total of bonds outstanding in 1944. Foreign bonds held in the U.S. are from balance of payments statistics and are at market value. Mortgage totals are derived mainly from tabulated reports of institutional lenders, with an allowance included for lender groups not covered by the tabulations. The totals are assembled jointly by the Commerce Department, the Federal Home Loan Bank Board, and the Federal Reserve.

Mortgage debt shown for savings and loan associations consists of loans still in process of disbursement. Such loans are included in the associations' assets at their fuil committed amount. U.S. Govern-
ment mortage debt is on residential properties acquired by the $D$ fense Department and Coast Guard. These mortgages appear in the Treasury Ownership Survey in the Treasury Bulletin as "nonsurveyed Government agency securities." They are included in the U.S. Government debt total (series X 2) but not in total Government securities outstanding (series X 293).

Household mortgage debt is entirely on owner-occupied residences. Nonfarm business mortgages are mainly on multi-family rental residential structures and commercial properties. They include small amounts of single-family debt that represent construction loans to builders.

## X 379-392. Summary of corporate equities market, 1945-1970.

Source: Board of Governors of the Federal Reserve System, Flow of Funds Accounts: Financial Assets and Liabilities Outstanding, 1945-1971; Flow of Funds Accounts: Annual Flows, 1946-1971; and unpublished data.

Holdings of corporate shares are shown here at current market values, based mainly on Securities and Exchange Commission (SEC) tabulations for shares listed on stock exchanges. Movements in these values have been much larger relative to net cash transactions than for debt securities shown in preceding series, and for this market the net transactions are shown separately here. Total market values are as calculated at the Federal Reserve for all shares except openend investment companies ("mutual funds"). The investment company total is for members of the Investment Company Institute (ICI). The totals include preferred as well as common shares. Purchases of domestic shares represent net new issues and are from the SEC and ICI. U.S. purchases of foreign shares in series X 392 represent net foreign issues, both new and existing, as shown in balance of payments publications.

For financial institutions most of the market values of holdings and net transactions are regularly reported either to trade associations or to the SEC. As in preceding series, household assets and net transactions are calculated residually. The figures indicate that in the later years shown, net purchases by life insurance companies and pension funds were larger than total new issues, while households received more from sales out of their equity portfolios than they paid for new share purchases. These net sales are shown here as negative net purchases and represent household funds transferred out of equities into other uses.

## Chapter X

## Net Public and Private Debt (Series X 393-409)

X 393-409. Net public and private debt, by major sectors, 1916-1970. Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics), Survey of Current Business, May 1969, p. 11; May 1970, p. 14; and May 1973, p. 13.

The source publications include details for the sectors shown here as well as data on gross debt.

Net debt for the public sectors of the economy represents total outstanding indebtedness minus intrasector holdings of such debt, e.g., total Federal debt minus such portions of that debt as are held by the Treasury and by Federal agencies. State and local debt includes State loans to local units. Net corporate debt represents total corporate debt minus intercompany debts of affiliated companies. Figures for the noncorporate private debt are gross, with no adjustment for intrasector holdings.

All sectors of both gross and net debt exclude (a) deposit liability of banks and banknotes in circulation, (b) value of outstanding policies and annuities of life insurance carriers, (c) short-term debt of individuals and unincorporated nonfinancial business concerns held by other individuals and unincorporated businesses, and (d) nominal corporate debt, such as bonds authorized but not issued, and issued but reacquired.

Series X 395 includes debt of Federal agencies included within the Budget. The debt of Federal agencies not included in the Budget is shown in series X 396. Series X 403 represents agricultural loans to farmers and farmers' cooperatives by institutional lenders. Series X 408 and X 409 include debt owed by farmers for financial and consumer purposes.

Series X 393-409. Net Public and Private Debt, by Major Sectors: 1916 to 1970
[In billions of dollars. As of end of year

${ }^{1}$ Net Federal debt (public and agency) is the outstanding debt held by the public as shown in The Budget of the United States Government, Fiscal Year 1974.
${ }^{2}$ Comprises the debt of federally sponsored agencies, in which there is no longer any Federal proprietary interest. Includes obligations of the Federal Land Banks, beginning 1947; debt of the Federal Home Loan Banks, beginning 1951; and debts of Banks for Cooperatives, beginning 1968.
${ }^{3}$ Long-term debt has a maturity of 1 year or more; short-term debt, less than 1 ${ }^{\text {year. }}$ Farm production loans and farm mortgages. Farmers' financial and consumer debt is included in the nonfarm categories. debt to brokers, and debt owed to life insurance companies by policyholders.

# Money Supply and Gold (Series X 410-443) 

## X 410-443. General note.

The supply of money, in the sense of a means of payment, is defined broadly to include bank deposits and currency. A more restricted definition of the active money supply includes demand deposits and currency held by the public. Time deposits, including funds deposited in the Postal Savings System, have occasionally been included in the definition of the money supply. Prior to 1934 , gold was also a part of the means of payment but in January of that year it was withdrawn from circulation, and, until August 1971, gold served as a means of settlement of international accounts only and, until March 1968, as a purely reserve money domestically.

As used here, the term "currency" includes coin and paper money issued by the Government and by banks. All currency is now issued by the Federal Reserve banks and the U.S. Treasury. In the series in this section three types of currency figures are shown: (a) Total currency stock (series X 420); (b) currency in circulation (series X 423-437), defined as coin and paper money outside the Treasury and Federal Reserve banks; and (c) currency outside banks, that is, currency in circulation less cash in the vaults of banks (series X 410).

Figures on currency in circulation have been compiled by the Treasury Department since 1800. They exclude currency held in the Treasury and Federal Reserve banks, gold and silver coin known to have been exported and, beginning January 31, 1984, all gold coin. They include currency held by the public within the United States, cash in the vaults of banks, currency lost or destroyed, and currency carried abroad and not appearing in the official gold and silver export figures.

At one time gold was the basic form into which all other types of currency could generally be converted. At present (1973-1974), however, the gold stock in most countries is held largely or entirely by central banks and Government treasuries. All gold belonging to the United States is held by the Treasury Department. Private gold holdings are forbidden except in limited amounts for licensed purposes. U.S. residents may purchase, hold, and sell domestic and foreign gold coins situated in the United States and minted before April 5, 1933. Gold coins minted after this date may be held if they have been determined to be of recognized special value to collectors. Gold may be held by Federal Reserve banks for account of foreign central banks or governments. Such earmarked gold, however, is not a part of the monetary gold stock of this country.

Prior to 1934, when gold coin and gold certificates were a part of the means of payment, they are included in series X 421, "currency held in Treasury"; series X 422, "currency in Federal Reserve banks"; and series X 423, "currency in circulation"; as well as in series X 424 and X 425, "gold coin" and "gold certificates" in circulation.

X 410-419. Money stock-currency, deposits, bank vault cash, and gold, 1867-1970.
Source: National Bureau of Economic Research, unpublished data. See also text for series X 263-275.
Series X 410-419 are annual averages of estimates by Milton Friedman and Anna Jacobson Schwartz.

Series X 411-413 represent total deposits adjusted, i.e., total deposits less U.S. Government deposits, interbank deposits, and cash items in process of collection. A distribution showing demand and time deposits is not available prior to 1915. Figures for bank vault cash are deducted from currency in circulation to arrive at currency outside banks.
$\mathrm{M}_{1}$ money supply, series X 414, includes currency outside the Treasury and bank vaults, demand deposits at all commercial banks,
and foreign demand balances at Federal Reserve Banks. $\mathrm{M}_{2}$ money supply, series X 415, includes all of the above plus time deposits at commercial banks. Deposits at nonbank thrift institutions are thus excluded from both $\mathrm{M}_{1}$ money supply and $\mathrm{M}_{2}$ money supply.

For additional descriptive detail, see Milton Friedman and Anna Jacobson Schwartz, Monetary Statistics of the United States, National Bureau of Economic Research (NBER), 1970.

The sources from which the estimates were derived are as follows:
X 410-416: 1867-1906 averages based on quarterly estimates from Monetary Statistics of the United States, tables 2 and 21; 1907-1946 averages, on end-of-month estimates from table 1 (ibid.), except that series X 416 is from Friedman and Schwartz, A Monetary History of the United States, 1867-1960, NBER, 1960, table A-2.
X 410-415: 1947-1963 averages based on monthly averages of daily figures from U.S. Board of Governors of the Federal Reserve System, Federal Reserve Bulletin, December 1970, except that series X 411 and X 415 are from Monetary Statistics..., pp. 48-50; 1964-1970 averages based on daily figures from the Federal Reserve Bulletin, November 1971.
X 416: 1947-1970 averages were derived from unpublished monthly averages of the Federal Reserve Board's daily estimates.

X 417: 1869-1878 averages based on end-of-June figures from the Annual Report of the Secretary of the Treasury, 1928, p. 552, minus gold presumed lost (see Annual Report, Director of the Mint, 1907, pp. 87, 92). 1878-1913 averages based on end-ofmonth figures from the Annual Report of the Secretary of the Treasury, 1898, pp. 59 and 109; 1903, pp. 173 and 205; 1909, p. 190 (corrected for the amount of gold presumed lost); and 1915, p. 319. 1914-1946 averages derived from U.S. Board of Governors of the Federal Reserve System, Banking and Monetary Statistics, 1943, pp. 536-538 and Supplement, section 14, p. 14 (for $1914-1933$, plus $\$ 287$ million to correct for gold presumed lost). 1947-1970 averages based on daily figures from Banking and Monetary Statistics, Supplement 10, pp. 16-19, and Federal Reserve Bulletin, monthly issues.
X 418: 1867-1906 averages based on annual or semiannual estimates in Monetary Statistics . . . , table 1; 1907-1946 averages derived from end-of-month estimates in table 1; 1947-1970 averages based on 12-month Federal Reserve Board estimates for the last Wednesday of the month from Monetary Statistics ...., table 1, and Federal Reserve Bulletin, monthly issues.
X 419: 1897-1954 averages based on annual or quarterly estimates from Monetary Statistics . . . , table 1; 1955-1970 averages based on 12-month estimates from Monetary Statistics .... pp. 42-52, and Federal Home Loan Bank Board, Selected Balance Sheet Data, All Operating Savings and Loan Assaciations.

## X 420-423. Currency stock and currency in circulation, 1800-1970.

Source: 1800-1859, U.S. Comptroller of the Currency, Annual Report, 1896, vol. I, p. 544; 1860-1970, U.S. Department of the Treasury, Annual Report of the Secretary of the Treasury, various issues. See general note for series X 410-443.

Currency stock (series X 420) and the total of its components (series X 421-423) involve a duplication to the extent that U.S. notes, Federal Reserve notes, Federal Reserve banknotes, and national banknotes, all included in full, are in part secured by gold, also included in full. The duplication of gold certificates, silver certificates, and Treasury notes of 1890 resulting from the equal amounts of gold
or silver held as security therefore has been eliminated. For a statement on this point, see footnotes to series X 420 and $X 421$. A description of security and reserves by type of currency is included in the text for series X 424-437, below. The text for series X 424437 also describes more refined estimates of gold coin in circulation, 1873-1907 and 1913-1933, which, if incorporated into series X 420423, would require similar adjustments in "total currency in the United States" and "currency in circulation."
The Annual Report of the Secretary of the Treasury for 1922 and subsequent years includes the following information concerning changes in the compilation of series X 420-423. The figures for 1860-1889 have been revised from the best data available in annual reports of the Secretary of the Treasury. The records are not complete and the figures for gold and silver in those years are only estimates. Beginning with 1890 , the compilation is based on revised figures for June 30 of each year and therefore differs slightly from the monthly circulation statements issued by the Treasury. The compilation reflects revisions to take account of other changes in the circulation statement, chiefly in 1922 and 1927. These revisions are explained in the Annual Report of the Secretary of the Treasury as follows: 1922, p. 433; 1928, pp. 70-71 and 551.

## X 424-437. Currency in circulation, by kind, 1800-1970.

Source: U.S. Department of the Treasury. Annual Report of the Secretary of the Treasury, 1947, p. 543; 1961, p. 686; 1964, p. 598; 1967, p. 656; and 1970, p. 240; except series X 437, 1800-1859, Annual Report of the Comptroller of the Currency, 1916, vol. II, p. 45.

See general note for series X 410-443 and text for series X 420-423.
More detailed annual data on currency stock and circulation, by kind, are shown in the annual reports of the Secretary of the Treasury and the Comptroller of the Currency.

The security and reserve provisions for the different types of currency are described in the Annual Report of the Secretary of the Treasury, 1972, p. 245.

X 425, gold certificates. Following the enactment of the Old Series Currency Adjustment Act in 1961, gold certificates (issues prior to series of 1934) are redeemable from the general fund of the Treasury and upon redemption will be retired. Prior to 1961, gold certificates were fully secured by gold in the Treasury.

X 427, silver certificates. Originally secured by silver bullion at monetary value ( $\$ 1.29^{+}$per fine troy ounce) and standard silver dollars held in the Treasury. Since enactment of the Old Series Currency Adjustment Act in 1961, silver certificates issued before July 1, 1929, have been payable from the general fund; certificates issued on or after July 1, 1929, became redeemable from the general fund on June 24, 1968.

X 428, Treasury notes of 1890. In process of retirement since March 1900 upon receipt by the Treasury. Until 1961, secured by silver and by gold reserve; thereafter, redeemable from general fund.
$\mathbf{X}$ 431, Federal Reserve notes. Federal Reserve banks secure Federal Reserve notes by depositing like amounts of collateral with Federal Reserve agents. The Federal Reserve Act, as amended, authorizes the use of the following assets for this purpose: (a) gold certificates or gold certificate credits; (b) certain discounted or purchased commercial paper; (c) securities issued by the United States; and (d) Special Drawing Rights certificates issued by the Exchange Stabilization Fund. Federal Reserve notes are obligations of the United States and are a first lien on all assets of the issuing Federal Reserve Bank. Following the enactment of the Old Series Currency Adjustment Act of 1961, funds were deposited by the Federal Reserve
banks with the Treasurer of the United States for the redemption of all Series of Federal Reserve notes issued before the series of 1928 .

X 432, Federal Reserve banknotes. Secured at issuance by direct obligations of the United States or by commercial paper. Since termination of their issuance on June 12, 1945, the notes have been in process of retirement, and lawful money has been deposited with the Treasurer of the United States for their redemption.

X 433 U.S. notes. Secured by a gold reserve until this requirement was repealed. The Act of May 31, 1879 required that the amount of U.S. notes then outstanding, $\$ 346,681,016$, be kept in circulation. The Old Series Currency Adjustment Act provided that this amount should be reduced by such amounts of notes as the Secretary of the Treasury might determine to have been destroyed or irretrievably lost. To 1970, the Secretary has made such determinations with respect to $\$ 24,142,000$ of the U.S. notes issued prior to July 1, 1929.

X 434, national bank notes. Secured at issuance by direct obligations of the United States. From December 23, 1915 these notes have been in process of retirement, and lawful money has been deposited with the Treasurer of the United States for their redemption.

The monetary value of gold was changed from $\$ 20.67$ per fine ounce to $\$ 35.00$ per fine ounce on January 31,1934 . The weight of the gold dollar was reduced from 25.8 to $15-5 / 21$ grains of gold, 0.9 fine.

More refined estimates of the amount of gold coin in circulation, 1873-1907, are contained in Bureau of the Mint, Annual Report of the Director of the Mint, 1907, p. 87; a discussion of the errors for which adjustments were made is given on pp. 66-95. For 1914-1933, the Board of Governors of the Federal Reserve System published revised estimates of gold coin in circulation (see Banking and Monetary Statistics, p. 409), which exclude $\$ 287$ million of gold coin reported in January 1934 as still in circulation because this amount is believed to have been largely lost or melted down, or otherwise to have disappeared from circulation over the years. The Federal Reserve series has been adjusted in this way for 1914-1933; no similar adjustment has been made in the data included in this volume for gold coin in circulation, total currency in circulation, or total currency stock.

## X 438-443. Changes in gold stock, 1914-1970.

Source: Board of Governors of the Federal Reserve System, 1914-1941, Banking and Monetary Statistics, p. 536; 1942-1957 (except series X 438 beginning 1953, X 441 beginning 1956, and X 443), Federal Reserve Bulletin, June 1949, p. 745, and April 1958, p. 503; series X 439 and X 442, 1958-1970, unpublished data. Series X 438, 1953-1970, X 440, 1958-1970, and X 443, 1942-1970, Federal Reserve Bulletin, January issues. Series X 441, 1956-1970, U.S. Bureau of the Census, Report FT 2402, annual issues.

For a discussion of the items shown here, see Banking and Monetary Statistics, pp. 522-523. See also general note for series X 410-443.

Also available in Banking and Monetary Statistics and various issues of the Federal Reserve Bulletin are annual data on gold inflow into the United States and contributing factors, net gold imports to the United States by country, and gold production by country.

The data for domestic gold production (series X 440) are those reported by the Director of the Mint, adjusted through 1945 to exclude Philippine production received in the United States. The data for net gold imports or exports (series X 441) are those compiled by the Department of Commerce. The figures for gold under earmark (series X 442-443) represent gold held by the Federal Reserve banks for foreign and international accounts; in the calculation of the changes in gold under earmark, however, consideration has also been given to gold held under earmark abroad for the account of the Federal Reserve banks in 1917-1933.

# Interest Rates and Security Markets (Series X 444-560) 

## X 444-560. General note.

Available statistics on interest rates and security prices indicate the cost of credit to borrowers-mainly business concerns and the Federal Government; and the income received by those who lend and invest-primarily individuals, trusts, endowments, banks, and other financial institutions. This section presents a variety of money rate and security market statistics, including principal short-term openmarket rates in New York City, the discount rate of the Federal Reserve Bank of New York, commercial paper and bankers' acceptances outstanding, bank rates on short-term loans to business, bond and stock yields and prices, security issues, mutual funds, margin requirements, stock market credit, and the volume of stock exchange trading.

## X 444-455. Money market rates, 1890-1970.

Source: Board of Governors of the Federal Reserve System. 1890-1941, Banking and Monetary Statistics, pp. 439-442, 448, 460; 1941-1963, Supplement to Banking \& Monetary Statistics, section 12, "Money Rates and Securities Markets," pp. 37, 48, and 50; 19641970, Federal Reserve Bulletin, monthly issues.

The rates shown here cover the most important short-term open market instruments in New York City, which is the chief money market of the country. The New York money market is composed of a number of specialized markets for certain types of borrowing and there are usually differences in rates corresponding to differences in the supply of funds relative to the demand for particular types of short-term funds in which the market deals. These markets are called "open" markets since transactions in them are usually made on an impersonal basis with the borrower and lender dealing through agents, as distinct from a "customer" market where the borrower and lender deal directly with each other and where transactions are often made on a personal basis. As a result, lenders may sell paper held, call loans, or refrain from renewing credits upon maturity more freely in the case of open-market paper than in the case of customer loans. Monthly and weekly figures for most of the series shown here are given in the source.

Rates on stock exchange loans are no longer published by the Board of Governors of the Federal Reserve System but data for these series for 1942-1962 were supplied by that agency. For stock exchange call loans (series X 447-448), a single rate only is available beginning in 1957.

Beginning 1929, a new measure of short-term rates became available with the issuance by the Treasury of a new type of security-the Treasury bill, which differs from other types of Treasury marketable securities in that it is sold on a discount basis instead of being offered in the market with a fixed coupon rate. Maturities of Treasury bills have varied up to 9 months, but usually have been 3 months. Two continuous series (X 450-451) are available beginning 1931.

The Federal Reserve Bank of New York discount rates shown (series X 454-455) are the lowest and highest rates during the year on discounts for and advances to member banks under sections 13 and 13a of the Federal Reserve Act. For the period prior to 1921, when a multiplicity of rates prevailed, discount rates on paper of a single class and maturity-usually the type of paper and maturity for which the rate was lowest-are shown. Specifically, from November 16, 1914, the day the Reserve Banks opened, through August 1916, the rate applies to discounts of commercial, agricultural, and livestock paper with maturities of from 31 to 60 days; and from September 1916 to December 1920, to discounts of, and advances
secured by, commercial, agricultural, and livestock paper with maturities of 15 days or less. Rates also apply to advances secured by obligations of Federal intermediate credit banks maturing in 6 months. For 1942-1945, the low rate shown is the preferential rate for advances secured by Government securities maturing or callable in one year or less. In this period the rate of 1 percent was continued for discounts of eligible paper and advances secured by such paper or by U.S. Government obligations with maturities beyond 1 year. The discount rates at all Federal Reserve banks and a description of the series through 1941 is contained in Banking and Monetary Statistics, pp. 422-424, 439-442, and thereafter in the Federal Reserve Bulletin.

X 456-465. Commercial and finance company paper and bankers' acceptances outstanding, 1918-1970.
Source: Board of Governors of the Federal Reserve System. 1918-1941, Banking and Monetary Statistics, pp. 465-467; 19421952, Federal Reserve Bulletin, February 1944, p. 170; January 1946, p. 59; February 1953, p. 146; and 1953-1970, Federal Reserve Bulletin, May issues.

Prior to 1948, figures for commercial paper represent the amount of paper outstanding as reported by the principal commercial paper dealers in the country. Some finance company paper sold in the open market is included. Beginning 1948, figures are for commercial paper and finance company paper combined, shown by method of placement. These data represent paper with an original maturity of 9 months or less (including some finance company paper sold in open markets) as reported by a varying number of dealers. Finance company paper placed directly with investors represents the amount reported by a varying number of finance companies. Prior to 1958, a small amount of finance company paper with an original maturity of more than 270 days was included; thereafter, all paper in this maturing group is included.

Figures for bankers' acceptances are amounts outstanding as reported by makers of bankers' acceptances, including banks and bankers in the United States and agencies of foreign banks in this country.

## X 466-473. Bank rates on short-term business loans, 1919-1966.

Source: Board of Governors of the Federal Reserve System. 1919-1938, Banking and Monetary Statistics, pp. 463-464; 19391963, Supplement to Banking \& Monetary Statistics, section 12, "Money Rates and Securities Markets," p. 61; 1964-1966, Federal Reserve Bulletin, March issues.

Data by months through 1938 and by quarters thereafter are available in the source publications. These data are compiled by the Board of Governors from reports submitted by member banks in leading cities throughout the country.

The reporting cities are representative financial centers having large loan markets. Interest rates charged by banks in these cities are more responsive to changes in general monetary conditions than are rates in other places. Because of the financial importance of the cities, their influence would predominate in any compilation designed to show movements of interest rates in large cities.

Figures for series X 470-473 represent averages of prevailing rates reported monthly by banks in a varying number of leading cities on commercial loans and time and demand security loans. These figures are not strictly comparable with those in series X 466469 but they are believed to represent bank rates on business loans. For series X 466-469, the figures for 1928-1938 are averages of prevailing rates reported monthly by banks in 19 principal cities on
business loans only; beginning in 1939, the figures are averages of interest rates charged by banks in the 19 cities on short-term business loans made during the first half of March, June, September, and December. For a description of the figures prior to 1939, see Banking and Monetary Statistics, pp. 426-427; beginning 1939, see Supplement to Banking \& Monetary Statistics, pp. 9-11. Beginning 1948, the source publication includes data on average interest rates by size of loan.

In 1967, these series were revised for expanded coverage. The new series cover new loans and loan renewals made during the first half of the middle month of each calendar quarter. The number of financial centers covered by the survey has been raised from 19 to 35 and the number of respondent banks from 66 to 126. For further details, see Federal Reserve Bulletin, May 1967.

## X 474-486. General note.

In addition to the sources cited for each individual series, these data (except series X 476 and X 479-482) appear also in U.S. Bureau of Economic Analysis (formerly Office of Business Economics), Survey of Current Business. Beginning with the January 1962 issue, the annual figures for the two most current years appear in every issue. Annual data back to 1947 appear in the 1971 edition of Business Statistics, a supplement to the Survey.

## X 474. Yields on U.S. Government bonds, 1919-1970.

Source: Board of Governors of the Federal Reserve System. 1919-1941, Federal Reserve Bulletin, May 1945, p. 483; 1941-1963, Supplement to Banking \& Monetary Statistics, section 12, "Money Rates and Securities Markets," p. 68; 1964-1970, Federal Reserve Bulletin, January issues.
Figures are unweighted averages of yields. For 1919-1925, yields cover all outstanding partially tax-exempt Government bonds due or callable after 8 years; for 1926-1934, all such bonds due or callable after 12 years; for 1935-1941, all such bonds due or callable after 15 years. For further description of the series, see Banking and Monetary Statistics, p. 429, and Federal Reserve Bulletin, May 1945, pp. 483 and 490. Beginning 1942, the series is for fully taxable bonds. Yields cover 1942-March 31, 1952, the bonds due or callable after 15 years; April 1, 1952-March 31, 1953, due or callable after 12 years; April 1, 1953-1970, due or callable in 10 years or more.

## X 475. Municipal high-grade bond yields, 1900-1970.

Source: Standard and Poor's Corporation, Trade and Securities Statistics, Security Price Index Record, New York, 1971 edition (copyright).

Prior to 1929, this series is an arithmetic average of the yield to maturity of 15 high-grade municipal bonds, based on the mean of monthly high-low prices. Beginning 1929, the series is an average of the 4 or 5 weekly indexes for the month. Annual figures are averages of monthly data. Monthly and weekly data are available in the source.

X 476. Unadjusted index number of yields of American railroad bonds, 1857-1936.
Source: Frederick R. Macauley, Some Theoretical Problems Suggested by the Movements of Interest Rates, Bond Yields and Stock Prices in the United States Since 1856, National Bureau of Economic Research, 1938, pp. A 142-161 (copyright).

The railroad industry was selected as the basis for a longtime study of bond yields because no other industry had securities of comparable importance as early as 1857, and for many years no other industry had as high a credit rating. The series is available before and after adjustment to eliminate economic drift due to secular changes in the quality of the bonds included. The unadjusted series is more comparable with currently available series. The series is a chain index number based on the arithmetic average of yields on long-term
high-grade railroad bonds. Yields for individual bonds are based on arithmetic averages of monthly high and low sale prices. With a few exceptions the index includes no bonds with maturities under 10 years, and since 1909 the minimum has been 14 years. The number of bonds on which the index is based was 13 in 1857 and increased gradually to 37 in 1900; it varied between 36 and 45 until 1930 and declined to about 28 in 1935. Annual figures are averages of monthly data.

## X 477. Corporate Aaa bond yields, 1919-1970.

Source: Moody's Investors Service, Moody's'Industrial Manual, New York, 1971 edition, p. a18 (copyright).
This series is an unweighted arithmetic average of the yields for individual bonds, based on closing prices. Prior to 1928, yields are based on the average of the month's high and low sale price for each bond; for 1928 and 1929, on biweekly closing quotations; for 1930 through October 1931, on weekly quotations; beginning November 1931, on daily closing quotations. Annual figures are averages of monthly data.

## X 478. Yields on preferred stocks, 1910-1970.

## Source: See source for series X 475.

For January 1910-January 1928, this index is computed from the average of the monthly high and low prices of 20 high-grade issues. All prices are converted to a price equivalent to $\$ 100$ par and a $\$ 7$ annual dividend before averaging. The yield index is computed from the average price. Beginning February 1928, the index is based on an average of the weekly yields, which are based on Wednesday's closing quotations for 15 (14 from April 1948-September 1965 and 10 thereafter) high-grade noncallable issues. The yield is determined for each issue and the average of the 9,8 , and 4 median yields, respectively, represents the group yield. Annual figures are averages of monthly data.

## X 479-482. Yields on common stocks (Cowles Commission), 1871-

 1937.Source: Alfred Cowles and Associates, Common Stock Indexes, 1871-1937, Principia Press Inc., Bloomington, Ind., 1939, pp. 372-373.

Yields are total actual dividends paid in each calendar year divided by total stock values as represented by an average of the monthly values for the year. The data employed in the construction of this index include, for 1871-1917, all industrial and public utility common stocks, and about 93 percent in market value of the railroad stocks traded on the New York Stock Exchange. The stocks and the periods of their inclusion are given in appendix II of the source volume. Subsequent to 1917 (in some cases 1926 or later) the stocks included in the Standard Statistics weekly indexes are used, which represent 90 percent of all common shares listed on the New York Stock Exchange. For further description of the indexes, see the source volume, pp. 1-50.

X 483-486. Yields on common stocks (Moody's), 1929-1970.
Source: Moody's Investors Service, Moody's Industrial Manual, New York, 1971 edition, p. a28 (copyright).
Annual figures are averages of monthly data which are dividends at annual rates based on latest company declarations divided by end-of-month prices.

## X 487-491. Basic yields of corporate bonds, by term to maturity,

 1900-1970.Source: 1900-1942, David Durand, Basic Yields of Corporate Bonds, 1900-1942, New York, 1942 (copyright); 1943-1955, National Bureau of Economic Research, unpublished data; 1956-1970, Scudder, Stevens, and Clark, New York, unpublished data. Series published monthly in U.S. Bureau of Economic Analysis, Survey of Current Business.

Greater detail than is shown here as to yield by years to maturity appears in Durand's volume.

Through 1950, the basic yield series represent the yields estimated as prevailing in the first quarter of each year on the highest grade corporate issues, classified by term to maturity; thereafter, the yields estimated in February only. These series are based on monthly high and low quotations of practically all the actively traded high-grade corporate issues outstanding since 1900 .

## X 492. U.S. Government bond prices, 1919-1970.

Source: Board of Governors of the Federal Reserve System. 1919-1940, Federal Reserve Bulletin, May 1945, p. 483; 1941-1963, Supplement to Money and Banking Statistics, section 12, "Money Rates and Securities Markets," p. 98; 1964-1970, Federal Reserve Bulletin, January issues.

Prior to 1942 , the prices are derived from average yields of partially tax-exempt bonds shown in series X 474 on the basis of a 4 percent 16 -year bond through December 1930 and on the basis of a $23 / 4$ percent 16-year bond for 1931-1941. For further description of the series, see Banking and Monetary Statistics, p. 429.

For 1942-March 31, 1952, figures for fully taxable issues are average prices of bonds due or first callable after 15 years; for April 1, 1952March 31, 1953, average prices of fully taxable marketable 21/2 percent bonds first callable after 12 years; beginning April 1, 1953, prices are derived from average yields on the basis of an assumed 3 percent 20 -year bond. The yield averages used are those on bonds maturing or callable in 10 years or more.

X 493-494. State and local government and corporate Aaa bond prices, 1900-1970.
Source: See source for series X 475, pp. 203 and 224.
The prices are a conversion of the yield indexes, assuming a 4 percent coupon with 20 years to maturity. For a description of the yield series for high-grade State and local government bonds, see text for series X 475. The corporate Aaa bond series is based upon the following: For 1900-1928, the monthly high-low price of 45 highgrade corporate bonds; for 1929-March 1937, a varying group of A1+ bonds, one price monthly (first of month); beginning April 1937, the average of the weekly $A 1+$ indexes. Annual data are averages of weekly figures.

## X 495-498. Index of common stock prices, 1871-1970.

Source: See source for series X 475 .
These indexes, which are based on the aggregate market value of the common stocks of all the companies in the sample, 500 stocks for all years ( 425 industrial, 25 railroad, and 50 public utility), express the observed market value as a percentage of the average market value during the base period. From January 1908 to date, these indexes are based on monthly averages of the Standard and Poor's stock price indexes. The indexes for earlier years have been converted to the 1941-43 base from the Cowles Commission stock price indexes, which are an extension of the Standard and Poor's indexes. The same method of construction was used for both, and, as far as possible the same companies. The formula used for this index is generally defined as a "base-weighted aggregative" expressed in relatives with the average value for the base period (1941-43) equal to 10 and with adjustments for arbitrary price changes caused by the issuance of rights, stock dividends, splitups, etc.

X 499-509. Security issues and net change in outstanding corporate securities, 1934-1970.
Source: U.S. Securities and Exchange Commission, Annual Report, 1952, pp. 210-221, and 1958, pp. 208-216; and Statistical Bulletin, May 1958, pp. 9-11, and subsequent issues; except series X 507-509, prior to 1960 , unpublished data.

The data for series X 499-506 cover substantially all new issues of securities offered for cash sale in the United States in amounts over $\$ 100,000$ and with terms to maturity of more than one year. Figures include issues privately placed and publicly offered, whether unregistered or registered with the Securities and Exchange Commission.
The figures for privately placed issues include securities actually issued but exclude securities which institutions had contracted to purchase but had not actually taken during the period covered by the statistics. Also excluded are intercorporate transactions; U.S. Government "Special Series" issues, and other sales directly to Federal agencies and trust accounts; notes issued exclusively to commercial banks; and corporate issues sold through continuous offering, such as issues of open-end investment companies. Issues sold by competitive bidding directly to ultimate investors are classified as publicly offered issues. The figures for new capital include all issues other than those whose proceeds are intended to be used for retirement of securities already outstanding.
The figures for series X 507-509 on net change in outstanding corporate securities are derived by deducting from estimated gross proceeds received by corporations through the sale of securities the amount of estimated gross payments by corporations to investors for securities retired. Included in the latter figures are payments for issues retired with internal funds as well as with proceeds from new issues sold for refunding purposes. These series are based primarily on cash transactions but include conversions and exchanges of one type of security for another, e.g., bonds for stocks.

## X 510-515. Corporate security issues, 1910-1934.

Source: 1910-1918, U.S. Bureau of Foreign and Domestic Commerce, Statistical Abstract of the United States, 1932, p. 292; 1919-1934, Board of Governors of the Federal Reserve System, Banking and Monetary Statistics, p. 487.

The Commercial and Financial Chronicle data used for these series, for 1919-1934, include all security issues publicly offered for sale by companies incorporated in the United States. Securities sold privately were included when the compilers were aware of the sale. Issues of foreign companies sold in the United States are excluded. Data are based on the offering price for preferred stock of no par value and for common stock, and on par amounts for bonds, notes, and preferred stock with stated par value. The data prior to 1919 include offerings of foreign corporations.

These series differ from those compiled by the Securities and Exchange Commission (series X 499-506) in a number of respects. The latter include issues on the basis of gross and/or net proceeds, whereas the Chronicle series include issues on the basis noted above. The Chronicle series include issues for exchange purposes, while the SEC figures include only that portion of such an offering that is sold for cash. The SEC series also include foreign corporate security issues sold in the United States, while the Chronicle series exclude them except for the period noted. The basis for inclusion of privately sold securities also differs.

## X 516. New State and local government security issues, 1919-1970.

Source: Board of Governors of the Federal Reserve System, 1919-1933, Banking and Monetary Statistics, p. 487. U.S. Securities and Exchange Commission, 1934-1945, Annual Report, 1952, part 3, p. 211. Board of Governors of the Federal Reserve System, 19461963, Supplement to Banking \& Monetary Statistics, section 12, "Money Rates and Securities Markets," p. 166; 1964-1970, Federal Reserve Bulletin, January issues.

Data represent principal amounts of securities offered publicly for sale in the United States by all political subdivisions either for new money or for refunding, retiring, or otherwise acquiring existing securities. They include loans from the U.S. Government. For 1919-1938, figures are as compiled and published by the Commercial and Financial Chronicle; for 1934-1956, they are from totals published
by the Chronicle and the Bond Buyer; beginning 1957, the figures are compilations of the Investment Bankers Association of America.

X 517-530. Market value and volume of sales of stocks and bonds on registered securities exchanges, 1935-1970.
Source: U.S. Securities and Exchange Commission, Statistical Bulletin, annual data in various issues (February, March, or April).
The data presented in these series are of two types depending upon the method of aggregation used by each exchange. Reports of some exchanges cover transactions cleared during the calendar month; clearances occur for the most part within five days of the execution of a trade. Reports for other exchanges cover transactions effected on trade dates falling within the report month. The variance introduced by these two different methods of aggregating the data is not considered to be significant and accordingly all registered exchanges are aggregated and reported in monthly summaries.

Stock data include voting trust certificates, certificates of deposit for stocks, and American Depository Receipts for stocks. Bond data have excluded transactions covering United States Government issues since March 1944. Warrants data include trading in rights for all periods.

## X 531-535. Volume of sales on New York Stock Exchange, 1900-1970.

Source: 1900-1909, Board of Governors of the Federal Reserve System, Banking and Monetary Statistics, p. 485; 1910-1970, Commercial and Financial Chronicle, New York.

Data on stocks (series X 531) show the volume of share trading in round lots on the New York Stock Exchange, as reported by the Exchange ticker; this series excludes odd lots, stopped sales, private sales, split openings, crossed transactions, and errors of omission. Data on bonds are exclusive of stopped sales and, beginning in July 1947, include bonds of the International Bank for Reconstruction and Development.

X 536-539. Net assets, sales, and redemptions of mutual funds, 1940-1970.
Source: Investment Company Institute, Washington, D.C., Mutual Fund Fact Book, 1970, and Statistical Work Book, No. 19.

A mutual fund may be defined as a company which combines the funds of many investors whose investment goals are similar, and in turn invests those funds in a wide variety of securities. The selection, purchase, and sale of individual securities by the mutual fund are conducted under the supervision of professional managers. Different mutual funds have a variety of investment objectives, management policies, and degrees of risk. Some funds place strong emphasis on capital growth; others stress current income or a balance between growth and income; some are highly speculative.

Most mutual funds are technically known as open-end investment companies because they stand ready at any time to redeem outstanding shares upon request by the investor. As open-end companies, the number of their shares is not fixed, with the outstanding total varying as new shares are sold to investors and shares are redeemed by investors upon presentation to the company. Shares are generally available from investment dealers or fund sales representatives. In most cases, the offering price includes a sales charge of $71 / 2$ to $81 / 2$ percent, with lower rates applying on larger purchases. The redemption price is generally the net asset value prevailing at the time the shares to be redeemed are received by the company. The net asset value per share is determined by most companies at least once a day, and is computed by dividing the current market value of the company's total net assets by the number of its shares outstanding.
The origin of investment companies and the concept of diversification date well back into the 19 th century. However, most of the growth in mutual funds in the United States, in both the number of companies and total assets, has occurred since World War II, and particularly in the 1950's and 1960's. Growth in net assets over the
years has been due not only to excess of share purchases over redemptions, but also to the long-term uptrend in market value of securities in which the mutual funds invest.
Mutual funds are regulated by both Federal and State governments. The major Federal statutes regulating investment companies are the Securities Act of 1933, the Securities Exchange Act of 1934, and the Investment Company Act of 1940. The latter regulates the creation and structure and many of the operations of investment companies. The Federal Acts are administered by the Securities and Exchange Commission.

## X 540-542. Federal Reserve Board margin requirements, 1934-1970.

Source: Board of Governors of the Federal Reserve System, 1934-1963, Supplement to Banking \& Monetary Statistics, section 12, "Money Rates and Securities Markets," p. 141; 1964-1970, Federal Reserve Bulletin, January issues.

Regulations T and U, administered by the Federal Reserve Board, limit the amount of credit that may be extended on a security by prescribing a maximum loan value, which is a specified percentage of its market value at the time of extension; the "margin requirements" shown are the differences between the market value (100 percent) and the maximum loan value.

## X 543-546. Stock market credit, 1931-1970.

Source: Board of Governors of the Federal Reserve System. 1931-1937, Banking and Monetary Statistics, p. 501; 1938-1963, Supplement to Banking \& Monetary Statistics, section 12, "Money Rates and Securities Markets," pp. 142-146; 1964-1970, Federal Reserve Bulletin, January issues.

Series X $543-545$ relate to credit extended by stock brokers on the basis of reports made by a group of firms estimated to account for at least 90 percent of total credit extended by security brokers and dealers in the United States. Data for 1931-1934 are estimates based on data collected by the New York Stock Exchange, and for 1935-1970 are based on reports collected by the Federal Reserve Board. Customers' debit balances represent credit extended by brokers to their customers, and money borrowed represents most of the credit obtained by these brokers, including money borrowed against customer collateral as well as that for their own activities. Customers' free credit balances represent customers' funds held by brokers pending investment or pending remittances to customers.

Customer credit in the stock market (series X 546) is defined as the sum of customers' net debit balances of the reporting firms, exclusive of those secured by U.S. Government obligations, and bank loans to others than brokers and dealers for purchasing and carrying securities exclusive of U.S. Government securities. As a result of changes in reporting, this series is not entirely comparable. Prior to 1955, customers' net debit balances include balances secured by U.S. Government obligations. Bank loans to others for purchasing and carrying securities are figures of weekly reporting member banks for the last Wednesday of the year, a series beginning in 1938. At the end of 1970 these banks accounted for about seven-tenths of all loans for this purpose. Loans for purchasing and carrying U.S. Government securities are excluded for all reporting banks for 1944-1952, and for reporting banks in New York City and Chicago for 1953-1970. For further details concerning the series, see Banking and Monetary Statistics, pp. 435 and 437-438, and Supplement to Banking \& Monetary Statistics, pp. 18-20.

## X 547-550. Brokers' loans, by groups of lenders, 1918-1938.

Source: Board of Governors of the Federal Reserve System, Banking and Monetary Statistics, p. 494.

These data were assembled from various sources and, where gaps occurred, estimates were made. The figures represent loans to brokers by principal groups of lenders-New York City banks, outside
banks, and others. Other lenders comprise foreign banking agencies, corporations, other brokers, and individuals. The figures cover primarily loans to brokers and dealers in New York City, most of whom are members of the New York Stock Exchange, but they include also loans to certain investment banking houses that do not have Stock Exchange seats and to brokers and dealers belonging to other stock exchanges. Comparable data are not available after 1938. For a more detailed description of the series, see Banking and Monetary Statistics, pp. 434-435.

X 551-560. Short- and intermediate-term consumer credit, by major types, 1919-1970.
Source: Board of Governors of the Federal Reserve System, 1919-1955, Supplement to Banking \& Monetary Statistics, section 16 (new), "Consumer Credit," p. 33; 1956-1970, Federal Reserve Bulletin, monthly issues.

Short- and intermediate-term consumer credit includes credit used to finance the purchase of commodities and services for personal consumption or to refinance debt originally incurred for such purposes. It also includes credit extended to individuals for the purchase of consumer goods that may be used in part for business.
Installment credit, series X 552-556, represents all consumer credit that is scheduled to be repaid in two or more payments. Revolving credit, budget, and coupon accounts are treated as installment credit rather than as charge accounts because they provide for scheduled repayment on a periodic basis. Published estimates of the amount of installment credit outstanding generally include the financing charges on such credit and the cost of insurance or other fees included in the credit contract.

Automobile paper, series X 553, represents credit extended for the purchase of new or used automobiles, whether or not the credit is specifically secured by the automobile purchased. Similarly, "other consumer goods paper," series X 554, represents credit extended for the purchase of such nonautomotive consumer goods as home appliances and furniture, jewelry, mobile homes, and boats.

Automobile credit and other consumer goods credit often are extended to the consumer by a retailer; sometimes the retailer will hold the paper for his own account, but in many instances he will sell it to a sales finance company, a commercial bank, or some other financial institution. In other instances installment paper represents loans made directly by lending institutions to consumers for the purchase of goods and services.

Repair and modernization loans, series X 555, include both Federal

Housing Administration-insured credit and noninsured credit extended to consumers to finance the maintenance and improvement of their homes. Such credit may be used for the purchase and installation of equipment, such as heating and air-conditioning systems, hot water heaters, storm windows, and kitchen equipment, as well as for major alterations and additions.
Personal loans, series $X$ 556, include all installment loans not covered in the previous categories that are made by financial institutions to individuals for consumer purposes. Many of these loans are obtained for the consolidation of consumer debts, for the payment of medical, educational, or travel expenses, and for the payment of taxes or insurance premiums. Some loans used for the purchase of automobiles or other consumer goods may be classified as personal loans because the lender cannot identify them with purchases of specific goods.
Noninstallment credit, series X 557-560, consists of those forms of consumer credit that are scheduled to be repaid in a lump sum.
Single-payment loans, series X 558, are noninstailment loans made directly to individuals for consumer purposes. Some credit of this type is used for the purchase of goods, but most is for meeting shortterm needs such as for the payment of personal taxes or life insurance premiums.
Charge accounts, series X 559, represent noninstallment balances owed to retail outlets for purchases made by consumers. These are open accounts ordinarily payable in full within 30 days of billing. The charge-account segment also includes the amounts consumers owe on accounts at gasoline service stations or on miscellaneous credit-card accounts and on home-heating-oil accounts. Such indebtedness differs from other charge-account credit in that it does not take the form of outstanding balances on the books of retail outlets.

Service credit, series X 560, consists of the amounts owed by consumers to professional practitioners and service establishments. The largest element in service credit is the amount owed to doctors, hospitals, and other suppliers of medical services. Amounts owed to public utilities, less deposits and prepayments, are also substantial. The remainder of service credit represents amounts owed for a wide variety of services, including education, recreation, and such personal services as laundry, cleaning, and dyeing.
Estimates are described in the Federal Reserve Bulletin for December 1968 and October 1972. They are based for the most part on sample reports submitted monthly and are adjusted periodically to more comprehensive data. Figures prior to 1940 are based largely on estimates of the Department of Commerce.

Series X 444-455. Money Market Rates: 1890 to 1970

[^216]${ }^{5}$ Bills quoted on bank discount rate basis. 8 Data for prior years not comparable; series includes the
following the auction, as trading begins on a when-issued basis.
${ }^{7}$ Preferential rate on advances secured by Government securities; see text.
8 Includes 1 or more interpolated items.

# Banking (Series X 561-820) 

## X 561-820. General note.

For general statistical purposes it may be said that a bank is a financial institution which accepts money from the general public for deposit in a common fund, subject to withdrawal or transfer by check on demand or on short notice, and makes loans to the general public. The historical series on assets and liabilities of banks refiect these activities and are the basic series on banking. Series X 561-619 and X 634-688 on principal assets and liabilities of banks and on number and total assets by class of bank cover all banks and all commercial banks. Series X 620-633 and X689-697 provide information on selected aspects of banking: Insured banks, branch banking, suspension of banks, earnings and expenses, bank debits and clearings, savings deposits, and Federal Reserve banks.

Collection and publication of banking and monetary statistics in the United States have been conditioned by the development of the banking and monetary system. Banks in this country have been in part under the jurisdiction of State governments and in part under the Federal Government. At the same time some banks operated before 1933 outside the jurisdiction of both governments, while other banks operated within the jurisdiction of both.

Supervision and regulation of banks have been a primary responsibility of the chartering authority. National banks, organized under Federal law enacted in 1863, are supervised by the Comptroller of the Currency, and State banks, by officials of the respective States.
Two other Federal entities with additional supervisory authority have been superimposed upon the existing banking structure: The Federal Reserve System, established in 1914 to exercise central banking functions, and the Federal Deposit Insurance Corporation, created in 1933 to insure bank deposits. The Federal Reserve System includes all national banks and such State banks as voluntarily join the System. Insurance of bank deposits was made obligatory for banks belonging to the Federal Reserve System and optional for others.
All the supervisory agencies have published some statistics for the banks under their jurisdiction, but there was no centralized collection of statistics for all classes of banks on a uniform basis until 1947. Prior to the National Banking Act of 1863, the only official collection of banking figures for the entire country was made by the Treasury Department under authority of a resolution of the House of Representatives passed in 1832. For 1833-1863, reporting by banks to the Secretary of the Treasury was voluntary. With the exception of some years, the Secretary of the Treasury included in his reports to Congress information regarding the number of State banks which reported to him. For 1863-1873, statistics of national banks only were published in the Annual Report of the Comptroller of the Currency.
The need for complete reporting was recognized in the act of 1873, which authorized the Comptroller to obtain balance-sheet data for nonnational banks from State banking authorities, Territorial authorities, or individual incorporated banks. Although coverage was improved, the data obtained were neither uniform nor complete because the various State and Territorial authorities did not request the same information from banks and some States had no department to collect the information. Moreover, in some States many so-called private or unincorporated banks operated outside the jurisdiction of State authority. The Comptroller annually requested that these banks report directly to him, but this procedure met with only limited success.

In spite of the difficulties of collecting statistics for all banks, the coverage and uniformity of the data became progressively better. This improvement came about principally because of greater uni-
formity in classification of balance-sheet information requested of banks, and because of the creation of banking departments in States that formerly had none, as well as more adequate collection and tabulation of data.
Efforts to promote uniformity in bank statistics culminated in 1938 when representatives of all Federal supervisory agencies worked out a standardized balance-sheet report form. This form was approved by the National Association of State Bank Supervisors and was adopted by the three Federal banking agencies and by many of the State banking departments. Nearly all States now use a form that is substantially consistent with the standard one.
In 1947, the Comptroller of the Currency, the Board of Governors of the Federal Reserve System, and the Federal Deposit Insurance Corporation, which compiled somewhat different balance-sheet data for all banks, worked out an arrangement for the Federal Deposit Insurance Corporation to compile semiannually a uniform series of statistics for all banking institutions.
To provide more adequate historical banking statistics comparable to those available beginning in 1947, the Board of Governors of the Federal Reserve System-with the cooperation of the Comptroller of the Currency, the Federal Deposit Insurance Corporation, and the State bank supervisory authorities-compiled a revised series for all banks in conterminous United States as of June 30 of each year, 1896-1955. These data were published in 1959 in Board of Governors of the Federal Reserve System, All-Bank Statistics, United States, 1896-1955. The series cover number of banks and principal assets and liabilities for major classes of banks. The publication also includes similar data for individual States, and for the U.S. outlying areas, which are not included in U.S. totals. Revisions in the earlier data affect primarily the nonnational components, and are largest for figures before 1920.
Compilation of the revised series for national banks presented no major problems. Since 1864, the Comptroller of the Currency has collected condition reports from 3 to 6 times annually from national banks, and has tabulated and published summaries of these reports showing principal assets and liabilities. National bank balancesheet data were published in detail in Abstract of Reports of Condition of National Banks (usually 3 or 4 times a year) through 1962. Assets and liabilities and income and expense data are published in summary form in the Annual Report.
Compilation of revised statistics for nonnational banks beginning in 1896 required extensive research into all types of available banking statistics. The main sources of information, other than the records of several large private banks, were the annual reports and statistical publications and records of the Comptroller of the Currency, the Bureau of Internal Revenue, the Board of Governors of the Federal Reserve System, the Federal Deposit Insurance Corporation, and State banking departments, as well as compilations published in bankers' directories. Unofficial compilations of figures for banks in several States were also used.
Under the arrangements made for all-bank data beginning with 1947, the 1947-1955 data in Board of Governors of the Federal Reserve System, All-Bank Statistics, United States, 1896-1955, were based on compilations of the Federal Deposit Insurance Corporation, except that data for "other areas," that is, the U.S. outlying areas, were included in U.S. totals.

A financial institution is considered a bank in the revised all-bank series if it accepts deposits from the general public or if it conducts principally a fiduciary business. This is the definition used by the Comptroller of the Currency, the Federal Deposit Insurance Corpora-
tion, and the Board of Governors of the Federal Reserve System in the all-bank statistics published beginning with 1947. For complete description of the types of institutions included and of those excluded, see Federal Deposit Insurance Corporation, Annual Report, 1956, pp. 88-89.

In 1969, the format and contents of the uniform quarterly Report of Condition and the annual Report of Income, adopted in 1947 by Federal bank supervisory agencies and used by banks in the United States, were substantially revised to provide a better measure of bank performance for the supervisory authorities and the public. Changes in these two reports were effected following extensive discussions among representatives of the Federal and State bank supervisory authorities and the banking industry. For a description of these changes, see the Federal Reserve Bulletin, August 1969, pages 642 ff . (Report of Condition) and the July 1970 issue of the Bulletin, pages 571-2 (Report of Income).

Beginning June 30, 1969, the three Federal bank supervisory agencies have issued jointly-as of the end of June and December of each year-aggregate data showing the major call report items for all banks in the United States grouped by class, size, and geographic location. This combined report entitled Assets and LiabilitiesCommercial and Mutual Savings Banks replaces the summary reports of condition formerly issued separately by each of the Federal bank supervisory agencies. The Federal Deposit Insurance Corporation has compiled, beginning in 1969, comprehensive income and end-ofyear balance-sheet information ior all insured commercial banks grouped by class, size, and geographic location in a report entitled Bank Operating Statistics.

## $X$ 561-688. General note.

Assets and liabilities are defined here in their usual accounting meaning. Assets are the resources of banks, such as loans, investments, reserves, cash, and balances with other banks; liabilities are the obligations of banks, such as demand and time deposits and capital accounts. The data presented in series X $580-619$, X 634-677, and X 683-688, prior to 1956, are for conterminous United States; thereafter, they include Alaska, Hawaii, and U.S. outlying areas.

## X 561-565. State banks-number of banks and assets and liabilities, 1811-1830.

Source: Writings of Albert Gallatin, edited by Henry Adams, J. B. Lippincott and Company, Philadelphia, 1879, vol. III, pp. 286, 291, and 296.
These are believed to be the most consistent series for the period before 1834. The figures are reprinted in Comptroller of the Currency, Annual Report, 1876, p. xl, which also contains estimates derived from an unofficial source of the number of banks, specie holdings, banknote circulation, and capital of banks in the United States for selected years, 1774-1804, and some discussion of early banking statistics. Figures in the Comptroller's report for 1876, together with some additional banking data for the period prior to 1834, are included in Comptroller of the Currency, Annual Report, 1920, vol. 2, p. 846.

## X 566-579. Second Bank of the United States-resources, liabilities, and profits, 1817-1840.

Source: Series X 566-577, U.S. Comptroller of the Currency, Annual Report, 1876, app. p. lxxxiii (except series X 577 for 1818-1837, Annual Report, 1916, p. 912); series X 578-579, Ralph C. H. Catterall, The Second Bank of the United States, University of Chicago Press, Chicago, 1903, p. 504.

The Second Bank was chartered by Congress in 1816 for 20 years. Renewal of the charter was denied and reorganization of the bank was effected by the Legislature of the State of Pennsylvania. The bank failed in 1841 and was finally liquidated in 1856. See headnote, table 94, p. 912, Comptroller of the Currency, Annual Report, 1916, vol. II; that page also shows assets and liabilities of the First Bank
of the United States in 1809 and 1811, the only two years for which data appear to be available.

X 580-587. All banks-number of banks and principal assets and Liabilities, 1834-1970.
Source: 1834-1896, U.S. Comptroller of the Currency, Annual Report, 1981, pp. 1018-1025; 1896-1955, Board of Governors of the Federal Reserve System, All-Bank Statistics, United States, 18961955, pt. I, pp. 30-33; 1956-1970, U.S. Federal Deposit Insurance Corporation, Annual Report, various issues.

These series represent a combination of data on two different bases: For 1896-1970, on the revised all-bank series basis and for 1834-1896, on the basis published in annual reports of the Comptroller of the Currency, which is known to provide incomplete coverage, especially of nonnational banks.

The historical tables in the 1931 Annual Report of the Comptroller of the Currency provide summary statistics by single years beginning in 1884 for (a) all reporting banks, (b) national banks (beginning in 1863), and (c) all reporting State and private banks (that is, nonnational banks). For nonnational bank data prior to 1873 the sources are as follows: For 1834-1840, Executive Document No. 111, 26th Congress, 2d session; for 1841-1850, Executive Document No. 68, 31st Congress, 1st session. For 1851-1863 (except 1852-1853), figures are from the report on the condition of banks for 1863. Those for 1853 are from Executive Document No. 66, 32d Congress, 2d session, and are incomplete. For 1852, the figures are estimates based on number of banks in 5 years, 1847-1851, and on assets and liabilities in 10 years, 1854-1863. For 1864-1872, all figures except number of banks and capital accounts are estimates based on data for the previous 10 years, 1854-1863.

Prior to 1896, figures shown here include all national banks and all State banks that voluntarily reported to State banking departments in the United States including mutual and stock savings banks, loan and trust companies, and private banks. A few banks in U.S. outlying areas are included. Data for nonnational banks for the earlier years are reported for dates other than June 30 and are known to be incomplete; many of the items have been estimated, as noted above. Where more reliable estimates prior to 1896 are available, they are included in alternate series X 678-682.

Beginning in 1896, more comprehensive data for nonnational banks than those included in the Comptroller's annual reports are available in All-Bank Statistics, 1896-1955, cited above. More detailed data than are shown here, by States and by class of banks, are available in this source, together with a description of the composition of the balance-sheet items, the methods by which the figures were compiled, and the classification of banks used.

Beginning in 1896, the figures include national banks and chartered or incorporated State banks, loan and trust companies, stock savings banks, and mutual savings banks. In conformity with the definition of a bank adopted in 1947, they also include unincorporated financial institutions which meet the definition of "bank"; cooperative exchanges in Arkansas which receive deposits; cash depositories in South Carolina; and Morris Plan and industrial banks (unless engaged merely in making loans and investments). In 1933 and 1934 only licensed banks, that is, those operating on an unrestricted basis, are included.

X 583, investments. For the national bank component, 18631865, total investments exclude securities other than those of the U.S. Government, which are included in "other assets" in the source. Total investments include all direct U.S. Government obligations and, since 1933, those fully guaranteed as to interest and principal by the U.S. Government; obligations of States and political subdivisions such as securities issued by States, counties, and municipalities, by school, irrigation, drainage, and reclamation districts, and by local housing authorities; and other securities, which comprise primarily obligations of domestic corporations, those of Government agencies not guaranteed by the United States, and foreign securities.

X 585, deposits. Total deposits for national banks for 1863-1865 include State banknotes in circulation and for 1866-1868, bills payable and rediscounts. Beginning 1942, deposit figures exclude reciprocal balances.
X 586, banknotes. Prior to 1864, figures represent State banknotes only; beginning 1896, national banknotes only. In 1865, a prohibitive tax was imposed on State banknotes and as a result only a few such notes were in circulation thereafter. Data for 1870-1910 exclude comparatively small amounts of State banknotes outstanding for which national banks, converted from State banks or merged with State banks, assumed liability.
X 587, capital accounts. Capital accounts include capital, surplus, net undivided profits, reserves for contingencies, and certain other reserve accounts. Capital is here used to designate primarily the original contribution of bank owners to the bank and is ordinarily evidenced by bank stock certificates. Surplus is ordinarily the amount of bank earnings specifically set aside as capital funds. Net undivided profits are earnings not yet set aside for dividends or allocated to surplus. In addition to reserves for contingencies, capital accounts include reserves for undeclared dividends and for accrued interest on capital notes and debentures as well as reserves for retirement of preferred stock or capital notes and debentures. Valuation reserves set up in connection with prospective but undetermined losses on loans, securities, and other assets are not included but are deducted from these assets. Prior to 1873, figures for nonnational banks include capital only; beginning 1933, the figures include preferred stock and capital notes and debentures.

## X 588-619. General note.

The following quotation concerning the role of commercial banks in the economy is taken from Board of Governors of the Federal Reserve System, Banking Studies, 1941, p. 169:

Commercial banks are part of the economic organization of the nation. They operate as business concerns and earn a living by rendering services to the public. By lending and investing money, they assist productive processes; by providing checking account services they facilitate and expedite the settlement of financial obligations. There are numerous other banking services, but most of them are related to the primary banking functions of making loans and investments and handling deposits. All these services and operations have to do with money, which may be viewed as the stock in trade of banks.
For further comment on commercial banks and the reason for their separate classification, see text for series X 683-688. See also text for series X 580-587 and general note for series X 561-820. The data presented in series X 588-619, prior to 1956, are for conterminous United States; thereafter, they include Alaska, Hawaii, and U.S. outlying areas.

X 588-609. All commercial banks-number of banks and principal assets and liabilities, 1896-1970.
Source: 1896-1955, see source for series X $580-587$, pt. I, pp. $34-37$; 1956-1970, see source for series X 580-587.

## X 610-619. All commercial banks-number of banks and total assets, by Federal Reserve membership and class, 1896-1970.

Source: Series X 610-611, X 612-615, (1969-1970), and X 616617, see source for series X 580-587; series X 612-615, (1956-1968), U.S. Federal Deposit Insurance Corporation, Assets and LiabilitiesCommercial and Mutual Savings Banks, semiannual issues; series X 612-613, prior to 1956, Board of Governors of the Federal Reserve System, Member Bank Call Report, various issues (with adjustments to bring these data into conformity with the revised all-bank series); series X 614-615, prior to 1956, derived by deducting from the totals for all commercial banks (series X 588-589) the figures
for all member banks (series X 610-613); series X 618-619, are all commercial banks (series X 588-589) less national banks (series X 634-635).

State member commercial banks are those banks chartered by the various States which have voluntarily requested membership in the Federal Reserve System and met the necessary requirements. Nonmember commercial banks are all other State-chartered banks (other than mutual savings banks). See general note for series X $561-820$ and text for series X 580-587 and series X 683-688.

X 620-633. All banks-number of banks and total assets, by deposit insurance status and class, 1934-1970.
Source: 1934-1955, Board of Governors of the Federal Reserve System, unpublished data (compiled in connection with All-Bank Statistics, United States, 1896-1955); 1956-1970, U.S. Federal Deposit Insurance Corporation, Annual Reports and Report of Call: Assets, Liabilities, and Capital Accounts-Commercial and Mutual Savings Banks, June issues, and unpublished data.

See general note for series X 561-820 and text for series X 580-587.
The Federal Deposit Insurance Corporation was created in June 1933 to pay depositors of failed banks the amount of their insured deposits. All national banks and all other member banks of the Federal Reserve System are required by law to be members of the Federal Deposit Insurance Corporation. Banks that are not members of the Federal Reserve System may be admitted to Federal deposit insurance upon meeting certain prescribed conditions.

Detailed statistics on assets and liabilities and earnings, expenses, and dividends of insured banks by class are available in Federal Deposit Insurance Corporation, Annual Report.

## X 634-655. National banks-number of banks and principal assets

 and liabilities, 1863-1970.Source: See source for series X 580-587.
See also general note for series X 561-820.
National banks are those chartered by the Federal Government and are under the general supervision of the Comptroller of the Currency.

X 656-677. Nonnational banks-number of banks and principal assets and liabilities, 1863-1970.

## Source: See source for series X 580-587.

Nonnational banks comprised all banks prior to 1863 (see general note for series X 561-820). These banks include State commercial banks, mutual and stock savings banks, private banks, loan and trust companies, and other institutions enumerated in the text for series X 580-587. For comment on incompleteness of nonnational bank data prior to 1896, see text for series X 580-587.

## X 678-682. Nonnational banks-number of banks and selected assets and liabilities, alternate series, 1865-1896.

Source: Series X 678-679, David I. Fand, Banks in the Post-Civit War Period in the United States, 1875-1896, unpublished doctoral dissertation on file at University of Chicago. Series X 680-682, 1875-1882, U.S. Comptroller of the Currency, Annual Report, 1885, pp. clxix-clxxiii (discussion of figures, p. ixviii). Series X682, 1865-1866, U.S. Federal Deposit Insurance Corporation, Annual Report, 1934, pp. 103, 112-113; 1867-1876, James K. Kindahl, Estimates of Nonnational Bank Deposits for the United States, 1867-1875, unpublished doctoral dissertation on file at University of Chicago, 1954, and Federal Deposit Insurance Corporation, Annual Report, 1934, pp. 112-113.

Data for all nonnational banks were compiled from tax returns submitted by banks during this period.

X 678-679, adjusted deposits and vault cash. Adjusted deposits as used here are total deposits (with original source figures adjusted
for nonreporting banks and for underreporting by banks) less cash items in process of collection. Data are as of August, 1875-1881, and June, 1882-1896. In the source volume, figures for nonnational commercial banks are shown separately from mutual savings banks.
Figures for capital accounts and total deposits (series X 681-682) are based on information included on semiannual tax returns and are monthly averages for 6 months ending May 31, 1876-1882, and for 6 months ending November 30, 1875.
The figures shown for total deposits (series X 682) for 1865-1876 are the sum of separate estimates for deposits of nonnational commercial banks and mutual savings banks. The methods of estimation are described in the sources cited above. The original source figures for commercial banks were adjusted for nonreporting banks but not for underreporting by banks.

X 683-688. Nonnational banks-number of banks and total assets, by class, 1875-1970.
Source: 1875-1896, U.S. Comptroller of the Currency, Annual Report, various issues; 1896-1955, see source for series X 580-587, pts. I and II; 1956-1970, see source for series X 580-587.
These series are a breakdown of number and total assets of nonnational banks shown in series X 656-657.
See also sources and text for series X 580-587.
State commercial banks are all banks other than national and mutual savings banks. The classification of banks as "commercial" is based on function or type of deposit business. Commercial banks include the holding of checking accounts and other deposits subject to withdrawal on demand, and the making of short-term self-liquidating loans to commerce, agriculture, and industry. Mutual savings banks, on the other hand, carry only savings and other time deposits (with some unimportant exceptions) and they invest their funds mostly in mortgage loans and securities. While the distinction between mutual savings and commercial banks is not strictly functional, since the great majority of commercial banks also carry varying proportions of savings and time deposits, it serves to segregate from banks holding demand deposits the group of banks that hold a large amount of deposits which represent principally savings. See series X 588-609 for balance-sheet data for all commercial banks, that is, national and State commercial banks combined.

Private banks are unincorporated institutions that operate ordinarily without a charter from either State or Federal Government. The number and relative importance of these banks has declined over the past half century.

The differences for 1896 in the data compiled by the Federal Reserve Board and by the Comptroller of the Currency indicate the incompleteness of early compilations of banking data, particularly in the case of private banks. Balance-sheet data are available in the Comptroller's annual reports for those banks submitting information to that agency. For separate figures for number and deposits of mutual savings banks, 1865-1896, see Federal Deposit Insurance Corporation, Annual Report, 1934, pp. 112-113.
In the source volume for 1896-1955, principal assets and liabilities are available separately for State commercial and mutual savings banks, by States, and for private banks in 18 States; in the remaining States, private banks were not segregated from other banks.
$X$ 689-697. Savings and other time deposits, by type of institution, 1820-1970.
Source: Series X 689, sum of series X 690-694. Series X 690691, National Bureau of Economic Research, unpublished data; see text for series X 418-419. Series X 692, U.S. National Credit Union Administration, 1970 Annual Report of the Administrator and 1970 State-Chartered Credit Union Annual Report. Series X 693, U.S. Post Office Department, Annual Report of the Postmaster General, 1957 and 1969. Series X 694, Board of Governors of the Federal Reserve System, 1892-1941, Banking and Monetary Statistics, pp. 34-35; 1942-1947, Federal Reserve Bulletin, January 1949, p. 41;

1948-1970, Federal Reserve Bulletin, September issues. Series X 695696, U.S. Bureau of the Census, Statistical Abstract of the United States, 1946, p. 404. Data furnished by the American Bankers Association. Series $\mathbf{X}$ 697, U.S. Comptroller of the Currency, 1820-1896, Annual Report, 1896, vol. I, p. 720; 1897-1910, Annual Report, 1920, vol. I, p. 241.

See general note for series X 561-820.
$\mathbf{X}$ 690, mutual savings bank deposits. For definition of mutual savings banks, see text for series X 683-688. See also text for series X 821-833.

X 691, savings and loan association deposits. For definition of savings and loan associations, see text for series X 834-844. Mutuallyowned associations accept deposits in the form of share capital; these are legally considered shares in the association and holders of shares are owners rather than creditors, as are depositors in banks. Other types of associations are those having some form of permanent stock ownership.

X 692, credit union deposits. A credit union is a cooperative nonprofit organization of individuals with a common bond of occupation, association, or residence. Its objectives are to promote thrift among its members and to provide them with a source of credit at reasonable rates of interest. Credit unions may be incorporated under Federal law or, currently (1970), under any of 44 State laws. Deposits include the purchase of shares, share certificates, or share deposit accounts in the credit union.
X 693, postal savings system deposits. The figures represent the balance to credit of depositors, including items shown on the balance sheets as unclaimed. They include both amounts redeposited in banks and amounts not so redeposited; they exclude amounts in banks in U.S. outlying areas. The Postal Savings System was discontinued as of April 27, 1966, and the accounts were eliminated after June 30, 1967.
X 694, commercial bank deposits. For definition of commercial banks, see general note for series X 561-820 and especially text for series X 588-609 and X 683-688. Deposit figures have been adjusted to exclude interbank deposits, which do not represent money available to the public, and items in process of collection, inclusion of which would represent a double counting of deposits. They exclude U.S. Treasurer's time deposits, open account, beginning 1939, and postal savings redeposited in banks. Beginning 1941, they exclude 3 member mutual savings banks.

X 695-696, national bank and State bank deposits. These data were originally furnished by the American Bankers Association, which discontinued this series after 1942. Savings and other time deposits include deposits evidenced by savings passbooks, time certificates of deposit payable in 30 days or over, time deposits (open account), postal savings redeposited in banks, and for some States, Christmas savings and similar accounts.

Series X 696 includes commercial, stock savings, and private banks and trust companies. Data shown for some of the years for these banks are incomplete for some States or have been estimated for others. Figures exclude 6 States in 1926 and 1927, 4 in 1928-1930, 3 in 1931, 2 in 1932 and 1933, and 1 in 1934-1937.

X 697, savings bank deposits. Data cover mutual and stock savings banks only.

## X 698-715. General note.

Deposits in commercial banks are the major portion of the current means of payment. The extent to which such deposits are used is measured by statistics of bank debits. In conjunction with deposit figures, debits figures are a means of determining the rate of turnover of deposits in commercial banks. While these two measurements throw light upon current economic developments, the data must be used with care to measure changes in business conditions. Since factors not related to business activity may affect debits and deposits, these data reflect changes in general business conditions only in a broad way.

## X 698-705. Bank debits and deposit turnover, 1943-1970.

Source: Board of Governors of the Federal Reserve System. 1943-1964, Supplement to Banking and Monetary Statistics, Section 5, "Bank Debits"; 1964 (revised)-1970, Federal Reserve Bulletin, (monthly data; annual averages from Federal Reserve Board).

Beginning with March 1953, the Board of Governors of the Federal Reserve System has published revised monthly bank debits series comprising only debits to demand deposit accounts of individuals, partnerships, and corporations, and of States and political subdivisions. Series X 698-701, which classify reporting centers into 3 groups-New York City, 6 other leading centers, and 338 other centers-provide a better measure of the activity of checking accounts than the discontinued series presented in X 706-709, which include debits to deposit accounts of the U.S. Government and to time deposits.

The turnover of demand deposits, series X 702-705, computed by dividing debits during a period (and converted to an annual rate) by average deposits against which the debits are made, indicates the number of times a deposit dollar is used during the period.

Monthly data on debits and annual turnover for the period beginning in 1943 are available in the Federal Reserve Bulletin, including a seasonally adjusted series for turnover.

X 706-709. Bank debits to deposit accounts, except interbank accounts, at reporting centers, 1919-1952.

Source: Board of Governors of the Federal Reserve System, 1919-1941, Banking and Monetary Statistics, pp. 234-237; 1942-1952, Federal Reserve Bulletin, June 1946, p. 630; June 1951, p. 665; and June 1953, p. 612.

Data for individual reporting centers, by months, for 1919-1941, are available in Banking and Monetary Statistics; for 1942-1952, they are available upon request from the Board of Governors of the Federal Reserve System.

Figures represent debits or charges on books of reporting member and nonmember commercial banks to deposit accounts of individuals, partnerships, and corporations, the U.S. Government, and State, county, and municipal governments, including debits to time and savings accounts, payments from trust funds on deposit in the banking department, and payments of certificates of deposit. Debits to accounts of other banks or in settlement of clearinghouse balances, payment of certified and officers' checks, charges to expense and miscellaneous accounts, corrections, and similar charges are not included. For a more detailed description of the data, see Banking and Monetary Statistics, pp. 230-233, and George Garvy, Development of Bank Debits and Clearings and Their Use in Economic Analysis, published in 1952 by the Board of Governors of the Federal Reserve System, especially chap. III, pp. 27-48.

Satisfactory figures are available for New York City and 140 other reporting centers, but the number of other reporting centers, and consequently the total number of all reporting centers, increased substantially for 1919-1952. (For details, see Banking and Monetary Statistics, p. 231, and Federal Reserve Bulletin, May 1952, p. 514.)

For revised data back to 1943, see series X 698-705.
X 710-715. Bank debits and deposit turnover, all commercial banks, 1919-1941.
Source: See first source cited for series X 706-709, p. 254.
For definition of debits, see text for series X 706-709; for definition of deposit turnover, see text for series X 698-705. Figures shown here are in part estimated; for a description of these series, see source, p. 232.

## X 716-724. Number of banking offices, by deposit insurance status, 1900-1970.

Source: 1900-1941, Board of Governors of the Federal Reserve System, Monetary Policy and the Management of the Public Debt, Joint

Committee on the Economic Report, 82d Congress, 2 d session, pt. I, p. 553; 1942-1970, U.s. Federal Deposit Insurance Corporation, Annual Report, various issues.

Additional statistics on the number of banking offices are included in Board of Governors of the Federal Reserve System, Federal Reserve Bulletin and Annual Report, and in Federal Deposit Insurance Corporation, Annual Report. The figures for 1900-1932 comprise national and all State-chartered banks except (a) mutual savings banks (data for which are not available until 1933) and (b) unincorporated or private banks not reporting to State banking authorities, other than certain large private banks which began to report to State banking authorities in 1934 and for which data are extended back to 1928. Separate data for State member banks are not available until 1933 (see text for series X 731-740). Beginning in 1942, the figures include banking facilities at military and other Government establishments; see series X 740. See also text for series X $580-587$, X 620-633, and X 731-740.

X 725-730. Bank deposits insured by the Federal Deposit Insurance Corporation and the Deposit Insurance Fund, 1934-1970.

Source: U.S. Federal Deposit Insurance Corporation, 1970 Annual Report, table 14.
See text for series X 620-633.
The Federal Deposit Insurance Corporation insured deposits in each account up to a maximum of $\$ 5,000$ from 1934 to September 1950; to $\$ 10,000$ from September 1950 to October 1966; to $\$ 15,000$ from October 1966 to December 1969; and to $\$ 20,000$ since then through 1970.

## X 731-740. Branch banking, 1900-1970.

Source: Board of Governors of the Federal Reserve System. Number of banks and loans and investments or deposits, 1900-1941, Banking and Monetary Statistics, pp. 297, 311 (for data on private and mutual savings banks, see also annual tables in the Federal Reserve Bulletin); number of branches, 1900-1951, Monetary Policy and the Management of the Public Debt, Joint Committee on the Economic Report, 82 d Congress, 2 d session, pt. I, p. 555; all series for all other years, Federal Reserve Bulletin, April, May, June, or July issues.

The figures for number of branches represent some revisions of data previously published in Banking and Monetary Statistics. Detailed statistics on branch banking by States, by class of bank, and by location of branches relative to the head office, for selected years since 1900 , are available in the sources indicated.
Branch banking is defined as a type of multiple-office banking under which a bank as a single legal entity operates more than one banking office. If a bank operates a single branch office, irrespective of size or functions, other than a "facility" as defined below, it is included here.
The statistics on branches include all branches or additional offices in conterminous U.S. prior to 1959, and include Alaska and Hawaii thereafter, within the meaning of section 5155, United States Revised Statutes, which defines a branch as "any branch bank, branch office, branch agency, additional office, or any branch place of business... at which deposits are received, or checks paid, or money lent." Branch figures, however, do not include banking facilities at military and other Government establishments, which began in 1942 through arrangements made by the Treasury Department with banks designated as depositaries and financial agents of the Government. The number of such facilities is shown separately in series X 740 .
Branch banking is not to be confused with group and chain banking. Group and chain banking refers to types of multiple-office banking which differ from branch banking principally in legal form and type of control. For data on group and chain banking, see sources cited above.
For mutual savings banks, data are not available for banks operating branches and number of branches until 1933; deposits are available
only for the years indicated. Branches of unincorporated (private) banks not reporting to State banking authorities are not included prior to 1934. Separate data for State member and nonmember banks of the Federal Reserve System are available only for the years shown.
Wherever available, figures on loans and investments or deposits of banks operating branches are shown. These figures include the combined deposits or loans and investments of banks and their branches. For 1900-1936, the figures present loans and investments; for 1937-1941 and 1949, they are deposits, except as noted.

## X 741-755. Bank suspensions-number and deposits of suspended banks, 1864-1970.

Source: Series X 741, sum of series X 742-745; series X 748, sum of series X 749-752. Series X 742-754 (except X 745 and X 752 for 1864-1920), 1864-1891, U.S. Comptroller of the Currency, Annual Report, 1981, p. 1040; 1892-1933, Board of Governors of the Federal Reserve System, Banking and Monetary Statistics, pp. 283 and 292. Series X 745 and X 752, 1864-1920, U.S. Federal Deposit Insurance Corporation, Annual Report, 1934, pp. 112-113; series X 755, 1921-1923, Annual Report, 1940, p. 66; series X 742747 and X 749-755, 1934-1970, unpublished data; series X 741 and X 748, 1934-1970, Annual Report, 1970.

More detailed statistics for 1921-1941 are available in Banking and Monetary Statistics, including the number and deposits of suspended banks, by States and by class of bank, and in the Federal Reserve Bulletin for September 1937, pp. 866-910, and December 1937, pp. 1204-1224. The annual reports of the Comptroller of the Currency contain considerable material relating to national banks placed in receivership and losses sustained by depositors and stockholders of national banks.

Comprehensive and dependable statistics on bank suspensions are available only for comparatively recent years, that is, beginning with 1921. Prior to 1921, the figures are useful principally in showing the periods of abnormal banking mortality. Statistics for State banks prior to 1892 are fragmentary and incomplete. While figures for 1892-1920 are believed to be somewhat more reliable than for earlier years, they are not strictly comparable with the figures shown for 1921-1970.
Beginning with 1921, detailed data on the number and deposits of suspended banks were compiled from original reports on bank suspensions. The term "bank suspension" has been defined to comprise all banks closed to the public, either temporarily or permanently, by supervisory authorities or by the banks' boards of directors on account of financial difficulties, whether on a so-called moratorium basis or otherwise, unless the closing was under a special banking holiday declared by civil authorities. In the latter case, if the bank remained closed only during such holiday, it was not counted as a suspension. Banks which, without actually closing, merged with other banks or obtained agreements with depositors to waive or to defer withdrawal of a portion of their deposits likewise were not counted as suspended.
The figures for number of suspended banks for 1933 are not wholly comparable with those for other years. It was difficult in that year to determine the status of some banks because of the changes brought about by the State and national banking holidays and the subsequent reorganization of the banking system. The 1933 figures comprise banks suspended before the banking holiday, licensed banks suspended or placed on a restricted basis following the banking holiday, unlicensed banks placed in liquidation or receivership, and all other unlicensed banks which were not granted licenses to reopen by June 30, 1933. This date was selected because by that time supervisory authorities had completed their examination of practically all the banks not granted licenses immediately following the banking holiday, and had authorized the reopening of banks that could qualify for licenses. Since 1933, suspensions of insured banks have been handled by the Federal Deposit Insurance Corporation.

Deposits for suspended banks are as of the date of suspension for member banks of the Federal Reserve System and for nonmember banks, as of the date of suspension or latest available call date prior thereto, with the exception of unlicensed banks included for 1933. Deposits of unlicensed banks included in suspensions for 1933 are (a) for national banks, as of the date of conservatorship; (b) for State member banks, as of June 30, 1933, or the nearest call date prior to liquidation or receivership; and (c) for nonmember banks, the latest figures available at the time the banks were reported as having been placed in liquidation or receivership, or (for those which later reopened) as of the date license was granted to reopen.
Methods used in deriving the figures for losses borne by depositors (series X 755) for the periods 1865-1880, 1881-1909, and 1901-1920, are described in Federal Deposit Insurance Corporation, Annual Report, 1940, pp. 61-73.
There were no bank suspensions in Alaska and Hawaii.

## X 756-767. Banks closed because of financial difficulties, 1934-1970.

Source: U.S. Federal Deposit Insurance Corporation, Annual Report, 1970, and unpublished data.

The Federal Deposit Insurance Corporation has used two procedures in fulfilling its responsibility to protect bank depositors from loss. It has paid depositors of insured banks placed in receivership up to the maximum limit prescribed by law and it has made loans to, or purchased assets of, financially distressed banks, thereby facilitating assumption of their deposits by another insured bank. The assumption of deposits by another bank enables business to continue with little or no deviation from normal routine, whereas a receivership may disrupt the economic life of the community.

Deposit figures at date of closing are adjusted to reflect subsequent corrections. In the case of banks placed in receivership, deposits at date of closing may be changed to include deposits discovered or reclassified after that date.

Data for losses to depositors in noninsured banks are not available. There were no bank failures in Alaska and Hawaii.

## X 768-791. General note.

The earliest available bank earnings data on a nationwide basis are those for national banks beginning in 1869. National banks were required to make earnings reports for the years 1869-1871 whenever dividends were declared; for 1872-1916, at least semiannually whether dividends were declared or not declared; for 1917-1961, for the periods ending in June and December; and for 1962 to the present (1970), annual reports for the calendar year. At first the report form included only cash dividends declared, net profits, and a few related items, but it became progressively more detailed and more comprehensive. Beginning with 1917, a breakdown as to the sources and disposition of earnings has been required.

## X 768-775. National banks-earnings and expenses, 1869-1970.

Source: 1869-1941, Board of Governors of the Federal Reserve System, Banking and Monetary Statistics, pp. 260-261; 1942-1970, U.S. Comptroller of the Currency, Annual Report, various issues.

Data are available for 1919-1941 for all Federal Reserve member banks (national and State member banks combined) in Banking and Monetary Statistics, pp. 262-265, and thereafter in various issues of the Federal Reserve Bulletin. For example, earnings and expenses are available by type; recoveries and profits, losses and charge-offs, and transfers to and from valuation reserves (beginning in 1948) are shown by character of asset. Data are also available for banks grouped by Federal Reserve District, State, class of bank, and size of bank. Various earnings ratios are available for part of the period.

The figures for gross and net current earnings before 1927 include profits on securities sold; such profits during the second half of 1926, when first reported separately, were $\$ 17,388,000$. The figures for gross and net earnings up to and including the fiscal year ending June 1919 also include recoveries on charged-off assets; such recoveries
in the fiscal year ending June 30, 1919, were $\$ 21,066,000$. Beginning in 1927 and 1919, respectively, these items are included in series X 772, which is the excess of total losses, charge-offs (including depreciation), and transfers to reserve accounts over total recoveries, profits, and transfers from reserve accounts, or vice versa.
Beginning 1969, data are not fully comparable with those for prior years: (1) net current earnings are reduced by a provision for loan losses; (2) X 770, expenses, includes only those income taxes applicable to current earnings; (3) the effect of taxes on other earnings is reflected in X 772; (4) X 772 is computed by summing securities gains or losses, extraordinary charges or credits, and the excess of transfers from reserves over transfers to reserves, all adjusted for tax effects.

X 776-791. Insured commercial banks-earnings and expenses, 1934-1970.
Source: U.S. Federal Deposit Insurance Corporation, 1934-1941, Annual Report, 1941, pp. 158-159 (except ratio of net profits to capital accounts which are from unpublished data); 1942-1970, Anaual Report, various issues.

For a definition of commercial banks, see general note for series X 561-820 and especially text for series X 588-609 and X 683-688.
More detailed data than are shown here are available in the source. See description of additional data available for national and other Federal Reserve member banks in the text for series X 768-775.
Prior to 1969, reports of income and dividends were submitted to the Federal supervisory agencies on either a cash or an accrual basis. In 1969, banks with assets of $\$ 50$ million or more, and beginning in 1970, $\$ 25$ million or more, were required to report consolidated income accounts on an accrual basis. Smaller banks continue to have the option of submitting their reports on a cash or an accrual basis, except that unearned discount on installment loans, and income taxes, must be reported on an accrual basis. For national banks and for State banks in the District of Columbia, not members of the Federal Reserve System, the data are collected by the Comptroller of the Currency; for State bank members of the Federal Reserve System, by the Board of Governors of the Federal Reserve System; for other insured banks, by the Federal Deposit Insurance Corporation.

Earnings data are included for all insured banks operating at the end of the respective years, unless indicated otherwise. Beginning 1958, appropriate adjustments have been made for banks in operation during part of the year but not at the end of the year.
Series X 787 is the excess of total losses, charge-offs, and transfers to reserve accounts over total recoveries, profits, and transiers from reserve accounts, or vice versa. Beginning 1969, series X 787 represents the combination of "extraordinary changes or credits" and "net securities gains or losses."

## X 792-795. Bank clearings at principal cities, 1854-1970.

Source: U.S. Comptroller of the Currency, 1854-1881, Annual Report, 1920, vol. 2, p. 849;1882-1919, Annual Report, various issues. 1920-1962, Commercial and Financial Chronicle, New York, N.Y.; 1963-1970, Dun \& Bradstreet, Inc., Monthly Bank Clearings Report, p. 2.
The first source cited above gives for New York the number of banks, capital, clearings, balances, average daily clearings, and average daily balances, for years ending September 30, 1854-1920.
For 1882-1919, figures are for all cities reporting to New York Clearing House Association and cover years ending September 30. Beginning 1920, all figures are for calendar years. For 1920-1935, series X 795 is for 146 identical cities. Beginning 1963, series X 793 is for 25 cities outside of New York City. The comparability of figures over the years is affected by (a) changes in the number of cities reporting and (b) the tendency toward consolidation of banks, eliminating former clearings between two or more banks. The source volume suggests that bank debits, series X 698-701 and X 706-709, are a better measure of volume of payment.

X 796-820. General note.
For purposes of administering the Federal Reserve System, the country is divided into 12 districts. There is a Federal Reserve bank in each district and most have one or more branches. Federal Reserve banks are organized as Federal corporations with capital stock subscribed by member banks in the respective districts. Member banks include all national banks and those State banks which have voluntarily requested membership and have met the requirements for joining the System. The number and total assets of national and State member banks are shown separately in series X 610-61s and for the two groups combined in series X 624-625.

The Federal Reserve banks are the principal medium through which the credit policies and general supervisory powers of the Federal Reserve authorities are carried out; they hold the legal reserves of member banks and perform for member banks many services related to those that commercial banks perform for the public, such as furnishing currency for circulation, facilitating the collection and clearance of checks, and providing discount facilities. The Reserve banks also act as fiscal agents, depositaries, and custodians for the U.S. Treasury and other Government units and perform numerous other important functions. The Federal Reserve banks are coordinated and supervised by the Board of Governors of the Federal Reserve System.

## X 796-805. Federal Reserve banks-principal assets and liabilities, 1914-1970.

Source: Board of Governors of the Federal Reserve System. 1914-1941, Banking and Monetary Statistics, pp. 330-332; 1942-1959, Annual Report, various issues; 1960-1970, Federal Reserve Bulletin, January issues.

Complete and detailed balance sheets for all Federal Reserve banks combined and for each bank are included in the sources.

Since 1934, the reserves of the Federal Reserve banks have consisted principally of the gold certificate account, which is backed dollar for dollar by gold in the Treasury. The supply of these reserves is dependent primarily upon the size of the monetary gold stock, or more precisely upon that part of the gold stock against which the Treasury has issued gold certificates or gold certificate credits. For a discussion of changes in the items affecting the reserves of Federal Reserve banks, 1914-1934, see Banking and Monetary Statistics, p. 325.

Deposits of Federal Reserve banks consist mainly of reserves of member banks, shown in series X 803. They also include the checking account of the U.S. Treasurer, deposits of foreign banks and governments, and other accounts, such as accounts of certain nonmember banks maintained for use in clearing and collecting checks and checking a ccounts of Government agencies. For further description of the items included in this table, see Banking and Monetary Statistics, pp. 324-329, and Federal Reserve System-Furposes and Functions, chap. XIII, pp. 173-190.

For statistical series presenting Federal Reserve balance-sheet items and monetary data related to member bank reserves, see Banking and Monetary Statistics, pp. 360-401; Federal Reserve SystemPurposes and Functions, chap. VIII, pp. 107-119; and the opening pages of the tabular section of Federal Reserve Bulletin, for example, March 1973, pp. A4-A8.

X 806-812. Federal Reserve banks-earnings and expenses, 19141970.

Source: Board of Governors of the Federal Reserve System. 1914-1962, Annual Report, various issues; 1963-1970, Federal Reserve Bulletin, February issues.

Federal Reserve banks are not operated for profit but they are selfsupporting. The nature and the amount of Reserve bank earnings depend largely upon the demand for Reserve bank credit on the part of the member banks and upon Federal Reserve policy as to open-
market operations. Most of the expenses of the Reserve banks are incurred in collecting checks, supplying currency, and performing other services from which no earnings are derived.

Until 1933, the law required that the net earnings of the Federal Reserve banks, after deduction of the annual 6 percent cumulative dividend on paid-in capital stock, be allocated to surplus and to a franchise tax paid to the U.S. Government. In 1933, Congress abolished the franchise tax at a time when Reserve bank earnings were small and after Congress had directed the Reserve banks to contribute half of their surplus to the capital of the Federal Deposit Insurance Corporation. From 1947 to 1958, the Reserve banks paid to the Treasury nine-tenths of their net earnings after dividends and after adjustments to maintain their surplus accounts at the level of subscribed capital; in 1959, they began paying all of such earnings to the Treasury. Since 1964, surplus has been maintained at the level of paid-in capital (which is one-half subscribed capital).

X 813-820. Federal Reserve banks-member bank reserve requirements, 1917-1970.

Source: Board of Governors of the Federal Reserve System, Annual Report and Federal Reserve Bulletin, various issues.

Legal limits: These data represent reserve requirements authorized by law (the Federal Reserve Act, as amended). Since the September 21, 1966, amendment, requirements have been established by the Board of Governors of the Federal Reserve System between specific minimums and maximums set by the law. On December 31, 1970, these legal limits for ratios of demand deposits were 10 percent and 22 percent for member banks in reserve cities, 7 percent and 14 percent for member banks not in reserve cities. Ratios of time deposits were 3 percent and 10 percent for all banks.

The Federal Reserve Act as approved December 23, 1913, provided for temporary reserve requirements for member banks to be effective for a period of approximately three years. Amendment to the Act on June 21, 1917, established percentages below which reserve requirements might not be set, but fixed no upper limits. Maximum limits at twice the legal minimums were provided by the Act of August 23, 1935. From August 16, 1948, through June 30, 1949, maximum limits were increased to permit changes in reserve requirements for the purpose of preventing injurious credit expansion. After June 1949 the limits returned to their former levels. A 1959 Act changed the maximum reserve requirement on demand deposits of banks in central reserve cities and in reserve cities from twice the legal minimum to 22 percent. Another provision of that Act discontinued the
central reserve city designation effective July 28,1962 , three years after passage of the Act. Maximums based on legal minimums for banks outside of reserve cities and for other classes of deposits at all banks were replaced temporarily in September 1966, and permanently in September 1968, by specific maximums and minimums.

Composition of reserves: The temporary reserve requirements in effect until 1917 authorized member banks to hold a part of their reserves as cash in their own vaults and a part on deposit with other banks. For a fuller discussion of these requirements and the 1917 amendment of the Federal Reserve Act, see Federal Reserve Bulletin, November 1938. Only balances with Federal Reserve banks could be counted as legal reserves from June 21, 1917, until late 1959. Since that time, member banks have also been allowed to count some portion of their vault cash as reserves. Effective December 1, 1959, vault cash in excess of 4 percent of net demand deposits could be counted by country banks. The percentage was decreased to $21 / 2$ on August 25, 1960. Central reserve city and reserve city banks were allowed to count vault cash in excess of 2 percent of net demand deposits effective December 3, 1959, and amounts above 1 percent beginning September 1, 1960. All member banks were allowed to count all vault cash as reserves effective November 24, 1960.

Net demand deposits are demand deposits subject to reserve requirements. In general, prior to 1917, net demand deposits were made up of (a) the gross amount of all demand deposits except those due to other banks, and (b) the net excess (if any) of demand deposits due to other banks over demand balances due from other banks and cash items in process of collection. From 1917 to August 23, 1935, the definition was substantially the same, except that U.S. Government deposits were exempt by law from all reserve requirements and were therefore excluded from net demand deposits. Beginning August 23, 1935, net demand deposits have been total demand deposits minus cash items in process of collection and demand balances due from domestic banks (also minus war loan and Series E bond accounts during the period April 13, 1943-June 30, 1947).

Reserve cities: Changes in the list of cities classified as "central reserve" and "reserve" for 1914-1960 are shown in the Supplement (1962) to Section 10 of Banking and Monetary Statistics. The central reserve city designation was terminated July 28,1962 . In 19621965, the reserve city designation was discontinued for five cities. Reserve cities on December 31, 1970, included the 36 cities where a Federal Reserve bank or branch is located plus the following: Columbus, Ohio; Des Moines, Iowa; Fort Worth, Texas; Indianapolis, Indiana; Miami, Florida; Milwaukee, Wisconsin; National Stock Yards, Illinois; St. Paul, Minnesota; Tulsa, Oklahoma; and Washington, D.C.
