# Market Absorption of Apartments

Third Quarter 1977 Absorptions  
(Completions in Second Quarter 1977)

**Figure 1. Units in Apartment Buildings Started, Completed, and Absorbed Within 3 Months: 1972 to 1977**

Note: Limited to buildings with five units or more in permit-issuing places

1. Source: Construction Report, C-20-77-9 (September 1977) Table 3.
2. Source: Construction Report, C-22-77-8 (August 1977) Table 1.

Privately financed apartments completed during the April-June 1977 quarter were absorbed after 3 months following completion at an estimated seasonally adjusted rate of 78 percent. This is about the same as the seasonally adjusted rate of 81 percent for apartments completed during the first quarter of 1977 (see table 3). The nonseasonally adjusted rate of 83 percent does not differ significantly from the seasonally adjusted rate. The median asking rent for these units was \$228. Apartments which have been on the market for 9 months (those completed during October-December 1976) were 98 percent rented.

Apartments renting for less than \$150 accounted for 2 percent of the second quarter completions. Apartments renting for \$250 or more accounted for 35 percent of the completions.

The data are based on a sample survey and consequently the figures cited above are subject to sampling variability. As shown in table 3, the 78 and 98 percent figures are subject to sampling errors (i.e., standard errors) of 2.5 and 0.9 percentage points, respectively. This means that there are about 2 chances out of 3 that a complete count would be in the range of  $78 \pm 2.5$  percent-

age points and  $98 \pm 0.9$  percentage points. Sampling errors for the figures that follow are indicated in parentheses.<sup>1</sup>

A total of 64,100 ( $\pm 1,600$ ) apartments were completed during the second quarter of 1977. Of this total, some 42,789 ( $\pm 1,670$ ) or 67 percent ( $\pm 2.3$ ) were of the type covered by the Survey of Market Absorption (SOMA), i.e., privately financed, unfurnished rental units built without Federal subsidy in buildings with 5 or more apartments.

Of the remaining 33 percent ( $\pm 2.3$ ), cooperatives and condominiums account for 15 percent ( $\pm 1.8$ ) of the total with a 3-month absorption rate of 77 percent ( $\pm 5.5$ )—see table 4. Furnished rental units account for 4 percent ( $\pm 1.0$ ). Also excluded from the survey are units in federally subsidized properties built under these programs of the Department of Housing and Urban Development: Senior Citizens Housing direct loans (Section 202), FHA below market interest rate mortgages

<sup>1</sup> See Reliability of Estimates on page 4.

**Table 1. CHARACTERISTICS OF APARTMENTS COMPLETED DURING THE SECOND QUARTER OF 1977 AND RENTED WITHIN 3 MONTHS**

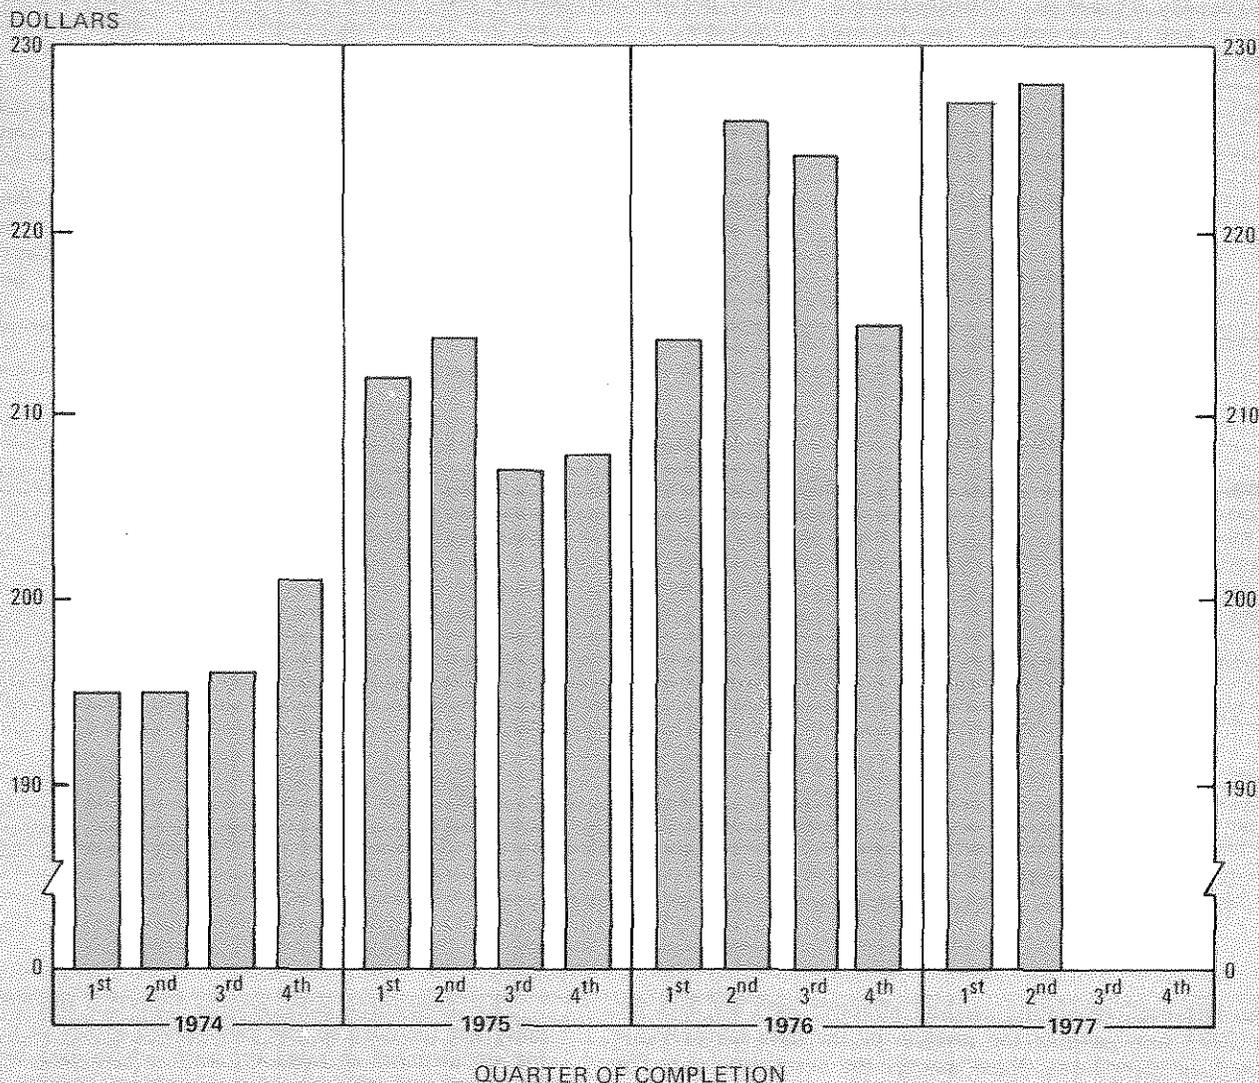

(Privately financed, nonsubsidized, unfurnished apartments. Data regarding number of bedrooms and asking rent are collected at the initial interview, i.e., 3 months following completion. Data not seasonally adjusted.)

3 or more.....	1,369	460	3	1.0	91	9.7

(X) Not applicable.

\*Standard error within range of about 2 chances out of 3.

**Figure 2. Median Rent of Apartments Completed in the United States: 1974 to 1977**

Note: Limited to buildings with five units or more in permit-issuing places.

(Section 236), and all units in buildings containing apartments in the FHA rent supplement program, which together account for 11 percent ( $\pm 1.6$ ). The remainder are excluded for other reasons including turnkey housing (privately built and sold to local public housing authorities subsequent to completion). The data, however, include privately-owned housing subsidized by State and local governments.

### SAMPLE DESIGN

SOMA is designed to provide data concerning the rate at which nonsubsidized and unfurnished privately financed units in buildings with 5 or more units are rented (or absorbed). In addition, data on characteristics of the units, such as rent and number of bedrooms, are collected.

In each quarter, a sample of about 2,000 buildings with 5 or more units completed during that quarter, is selected. The sample is selected from buildings reported as completed in a sample of building permits in the Census Bureau's Housing Starts Survey.<sup>2</sup> Buildings completed in nonpermit-issuing areas are excluded from consideration in this survey.

Information is obtained for the units in the buildings selected in a given quarter in each of the next four quarters on the proportion of units occupied, 3, 6, 9, and 12 months after completion.

<sup>2</sup> See "Housing Starts," Construction Reports Series C20, for the details of this survey.

**Table 2. CHARACTERISTICS OF APARTMENTS COMPLETED DURING THE FIRST QUARTER OF 1977 AND RENTED WITHIN 3 MONTHS (REVISED)**

(Privately financed, nonsubsidized, unfurnished apartments. Data regarding number of bedrooms and asking rent are collected at the initial interview, i.e., 3 months following completion. Data not seasonally adjusted.)

Item	Total units completed		Percent of total units		Percent rented within 3 months	
	Number	Sampling error*	Percent	Sampling error* (percentage points)	Percent	Sampling error* (percentage points)
Total.....	41,651	1,730	100	(X)	77	2.6

3 or more.....	1,640	500	4	1.2	65	14.8

(X) Not applicable.

\*Standard error within range of about 2 chances out of 3.

An improved tabulating method effective with the data for year 1973 now permits the revision of the data for previous quarters of completion. Each quarter the absorption data for some buildings are received too late for inclusion in the report. With the new technique it is now possible to revise the data for the previous quarter to reflect these buildings (see table 2).

### ESTIMATION

The estimation procedure used in the survey involves, as a final step, the inflation of the weighted sample results to the quarterly estimates of housing completions obtained from the Housing Completions Survey. As the Housing Completions Survey is based on a larger sample than the SOMA, it provides a more stable set of controls for estimates which can be obtained from both surveys. In addition to reducing the sampling variability of the estimates of totals from the SOMA, the ratio estimation procedure, as a useful byproduct, produces estimates of the units completed in a given quarter which are consistent with the published figures from the Housing Completions series.<sup>3</sup>

<sup>3</sup>See "Housing Completions," Construction Reports, Series C22.

The absorption rates assume that the absorption rates of units not included in the interviewed group or not accounted for are identical to rates for units where data were obtained. The noninterviewed and not accounted for cases comprise less than 2 percent of the sample housing units in this survey.

### RELIABILITY OF ESTIMATES

The sample used for this survey is only one of a large number of possible samples of the same size that could have been selected using the same sample design, sample selection, and measurement procedures. Estimates derived from these samples would differ from each other.

The standard error of a survey estimate is a measure of the variation among the estimates from all possible samples and is, therefore, a measure of the precision with which an estimate from a particular sample approximates the average result of all possible samples. As calculated for this report, the standard error also partially measures the effect of certain nonsampling errors but does not measure any systematic biases in the data. Bias is the difference, averaged over all possible samples, between the estimate and the desired value. The accuracy of a

\*Standard error within range of about 2 chances out of 3.

survey result depends upon the sampling and nonsampling errors, measured by the standard error, and the bias and other types of nonsampling error, not measured by the standard error.

The estimate and its associated standard error may be used to construct a confidence interval, that is, if all possible samples were selected, each of these surveyed under essentially the same general conditions and an estimate and its estimated standard error were calculated from each sample, then approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average value of all possible samples.

The average value of all possible samples may or may not be contained in any particular computed interval. But for a particular sample, one can say with specified confidence that

the average of all possible samples is included in the constructed interval. Similarly, the chances are about two out of three that the survey estimate will differ from the average result of all possible samples by less than one standard error, and 99 out of 100 that the survey estimate will differ from the average result by less than 2 1/2 times the standard error. For example, the chances are 95 out of 100 that the number of two-bedroom apartments (20,289) would be no lower than 17,189 or no higher than 23,389 if the data were collected in a complete census. The conclusions stated in this report are considered significant at the 95 percent confidence level.

In addition to sampling error, sample surveys are subject to response and processing errors similar to those experienced in censuses. The data in this report are preliminary and subject to slight changes in the annual report.

# Value of New Construction Put in Place

## 1947 to 1974

This supplement to the Construction Reports, C30, provides data on the value of new construction put in place for 1947-1974.

### Features ...

- Annual data for 1947-1974
- Monthly data for 1958-1974
- Previously published data from 1915 through 1946

(please detach along this dotted line)
