ESTIMATES OF THE POPULATION OF STATES, BY AGE: 1965 TO 1967 With Provisional Estimates for July 1, 1968

(Estimates for the years 1965 through 1967 shown here supersede corresponding estimates published in report No. 384 of this series)

This report presents estimates of the total resident population by age groups for 1967 and provisional estimates for 1968. The age groups shown for 1967 are: under 5 years, 5 to 17 years, 18 to 44 years, 45 to 64 years, and 65 years and over, plus the cumulative age groups 14 years and over, 18 years and over, and 21 years and over. For 1968, the age groups shown are: under 18 years, 18 to 64 years, and 65 years and over, plus the cumulative age groups 18 years and over and 21 years and over. Revised estimates are also shown for 1965 and 1966 in the age detail shown for 1967.

METHODOLOGY

Estimates for 1967.--The estimates for all States were obtained by carrying forward the 1960 Census data (after subtracting the estimated size of the Armed Forces) for each of the age groups for each State, and allowing for births, deaths, net civilian international and interstate migration, the net movement of civilians into the Armed Forces between April 1, 1960, and the estimate date, and the number of Armed Forces stationed in each State on the estimate date. As a final step, the estimates were so adjusted that the sum of the estimates of the five broad age groups for each State equaled the estimate of the total resident population of that State published in Current Population Reports, Series P-25, No. 414. In addition, the sum of the State estimates for each age group was adjusted to equal the latest national population estimates in that age group.¹

To estimate net civilian migration for a State, migration rates were derived for each age group except age 65 years and over from the State's estimated migration rate for school-age children for the period April 1960 to July 1967. Specifically, the net civilian migration rate, 1960 to 1967, for each age group in a given State was derived by (1) obtaining the ratio of the national gross interstate migration rate for that age group to the national rate for the age group 7.50 to 15.49, and (2) applying this ratio to the State's net migration rate for the age group 7.50 to 15.49.

¹National population estimates, by age, for 1967 are published in Series P-25, No. 385.

Net migration rates for ages 7.50 to 15.49 by States had previously been estimated in the course of preparing the estimates of the total population of States for 1967 shown in Current Population Reports, Series P-25, No. 414. (The method used in estimating migration rates for children of school age is described in that report. It employs data on elementary school enrollment and data on age from the 1960 Census.)

The national interstate migration rates are based on estimates of interstate migration by age obtained annually from the Current Population Survey, the Bureau's continuing national sample survey of population.² The ratios of the national migration rates for broad age groups to the rates for the school-age population 7.50 to 15.49 years old for the period April 1960 to July 1967 are as follows:

<u>Age group on estimated date</u>	<u>Ratio</u>
Under 5 years.	0.5890
5 to 17 years	0.9840
18 to 44 years.	1.4317
45 to 64 years.	0.4592

These are relationships among gross interstate migrants for the United States as a whole. Obviously, migration ratios for individual States may vary from the National ratios; however, annual migration figures for States are not available. Moreover, the net ratios by age could well differ from the ratios of gross rates. Nonetheless, it is assumed here that these same ratios apply equally to all States, and also for a given State, that the direction of the net migration is the same for all of the broad age groups under 65.

Examination of the Current Population Survey material on annual interstate migration has indicated that, given the specific age pattern of migration rates shown by the Current Population Survey for the last several years, the ratio of the net migration rate of a particular age group to the

²U.S. Bureau of the Census, Current Population Reports, Series P-20, No. 171, "Mobility of the Population of the United States: March 1966 to 1967," April 30, 1968, and the corresponding reports for earlier years of the decade.

net migration rate of the "school-age" population (7.50 to 15.49) will vary with the length of the estimating period. Thus, the ratio of a 6-year period is different from the corresponding ratio for a 1-year period.

The procedure developed to derive the ratios shown above is as follows: Annual migration rates by single years of age for each year 1960 to 1967 were derived by graphic interpolation of the data for broad-age groups for each year provided by the Current Population Survey. The interpolated migration rates were then applied to annual estimates of population by single years of age, and the resulting estimates of the number of migrants in each year of age were cumulated by cohort as required for the estimating period. For example, the number of persons 45 to 64 years of age on July 1, 1967 who had migrated during the period April 1, 1960 to July 1, 1967, was derived by summing the number of persons 45 to 64 years old on July 1, 1967 who had migrated between July 1, 1966 and July 1, 1967; the number 44 to 63 years old on July 1, 1966, who had migrated between July 1, 1965, and July 1, 1966; and so on to April 1, 1960. The number of migrants was then converted into a migration rate by dividing by the appropriate population in 1960. In a similar manner, migration rates for the period April 1, 1960, to July 1, 1967, were computed for the "school-age" group. The migration rate for the "school-age" children was then divided into the migration rates for these age groups to derive the ratios shown above.

The initial migration estimates derived for the age groups under 65 in each State were adjusted to be consistent with independent State migration totals for all ages implied in the State estimates published in Current Population Reports, Series P-25, No. 414. (Estimates of the population 65 years old and over are independently developed and added as a final step without any adjustment.) The effect of this adjustment on the age estimates is discussed in the section "Accuracy of estimates" below.

The net movement of civilians into the Armed Forces for each State was estimated for each age group by subtracting (1) the number of persons in that age cohort serving in the Armed Forces on April 1, 1960, who reported the State as their preservice residence from (2) the number of persons in the age group serving in the Armed Forces on the estimate date who reported the State as their preservice residence. To this was added an allowance for former residents of the State in the age cohort who died during this period while serving in the Armed Forces.

Estimates of the population 65 years of age and over for 1967.--In previous reports, estimates of the population 65 years and over were developed by a cohort-component procedure in the same manner as other age groups, with the migration component based on data on interstate migration of aged beneficiaries obtained from the Social Security Administration. With this report, however, the Bureau of the Census is initiating a change in procedure. Estimates of the group 65 years and over for July 1, 1967, represent basically the number of persons covered by the "Medicare" program.³ This new source represents an improved basis for estimating the population 65 years old and over because of the very high rate of participation of the age group in the program.

The distribution, by State, of the reported number of persons covered under the Medicare hospital insurance program, plus 30,000 retired Federal employees enrolled in the supplemental medical insurance program but not eligible to receive hospital insurance benefits was adjusted to add to the July 1, 1967, independent national estimates of persons 65 years old and over. No adjustment was made in the State distribution for an undetermined number of persons excluded from the provisions of the program pending more precise information on the number and geographical distribution of these persons.

For the United States as a whole, the Medicare figure for July 1, 1967, exceeded the independent population estimate by 280,000, or about 1.5 percent. The relative differences between the two sets of estimates for 1967 for States are shown in the appendix table.

By far the largest group excluded from the basic hospital insurance plan of the Medicare program is persons not entitled to cash retirement benefits under Social Security who had an opportunity for protection under the Federal Employees Health Benefit Act of 1959. This exclusion affects mainly Federal employees 65 years of age and over who had retired after the health benefits act became available. This may lead to some understatement in the population based on Medicare numbers in areas where large numbers of Federal retirees live.

³Social Security Administration, Office of Research and Statistics, Health Insurance Enrollment Under Social Security, July 1, 1966, and U.S. Congress, House Committee on Ways and Means, 1st Annual Report on Medicare, 90th Congress, 2nd Session, House Document No. 331, U.S. Government Printing Office, Washington, 1968.

Also excluded under the Medicare program are aliens 65 and over with less than five years of consecutive residence in this country. A small number of persons who have been convicted of crimes against the security of the United States of America are also excluded from coverage.

Estimates for 1965 and 1966.--Estimates for July 1, 1965 and 1966 were derived in the same manner as those for July 1, 1967, except in the case of the population 65 and over. As a first step estimates of the population 65 years and over for 1965 and 1966 were developed using data on interstate migration of "aged beneficiaries" for each State obtained from the Social Security Administration to measure net migration for the group (the procedure used in previous reports to estimate the population 65 and over). Then, to achieve comparability between the 1967 estimates and those for 1965 and 1966, the difference between the 1967 estimates based on Medicare and 1967 estimates based on aged beneficiary data was computed.⁴ This difference was added to (or subtracted from) the estimates for 1965 and 1966 based on the beneficiary data in proportion to the number of years since 1960.

Provisional estimates for 1968.--The estimates for July 1, 1968, were also derived by a component approach similar to that used for preparing the estimates for 1967. Here, however, data by age for the components of population change were not available for the period beyond July 1, 1967. Provisional estimates of the total population of States for July 1, 1968, and of the components of change (i.e., births, deaths, net civilian migration, and movement of civilians into the Armed Forces) for the period April 1, 1960, to July 1, 1968 had already been developed in connection with 1968 State totals published in Series P-25, No. 414. Consequently, each of these components was then distributed to appropriate age cohorts, using as a basis for distribution the data by cohort developed in connection with the July 1, 1967, estimates described above. The estimates were also adjusted so that the total population of each State agreed with the provisional State total and the sum of each age group for States agreed with the latest national population estimates for these groups.

POPULATION BASE

This report makes use of the 1960 population, by age, published in table 16, Volume I of the 1960 Census of Population, for each State. In the use of the census numbers in the preparation of current estimates, by age, there has been no adjustment for net undercounts, either in the national or State data, although it is recognized that there were both underenumeration and misreporting in the census.⁵

A number of evaluation studies relating to the accuracy of the 1960 Census by age, sex, and color have been carried out. Some of the results of these Evaluation and Research Programs have been published in Series ER-60 and in various articles.⁶

SOURCES OF DATA

The estimates given in this report are based on age data from the 1960 Census; statistics on births and deaths provided by the National Center for Health Statistics, U.S. Public Health Service; statistics relating to the Armed Forces provided by the Department of Defense; and estimates of net interstate migration, developed, in part, from official records of school enrollment obtained from the U.S. Office of Education, State Departments of Education, Catholic school systems throughout the country, and The Official Catholic Directory, and in part from statistics provided by the Social Security Administration on the movement of aged beneficiaries covered by old age and survivors insurance and statistics on persons enrolled under the Medicare program. Data on school enrollment for selected States were also obtained from the Bureau of Indian Affairs.

⁴The number of persons covered in Medicare were first reported by State for July 1, 1966. Since the program was new, it was thought desirable to have an additional year of experience before taking full advantage of the Medicare reporting system.

Siegel and Melvin Zelnik, "An Evaluation of Coverage in the 1960 Census of Population by Techniques of Demographic Analysis and by Composite Methods," Proceedings of the Social Statistics Section 1966 (American Statistical Association). Jacob S. Siegel, "Completeness of Coverage of the Nonwhite Population in the 1960 Census and Current Estimates, and Some Implications," Conference on Social Statistics and the City: Report of a meeting held in Washington, D.C., June 22-23, 1967 (ed. David M. Heer), Joint Center for Urban Studies of the Massachusetts Institute of Technology and Harvard University.

The birth and death statistics used in preparing the estimates for States include final reports on births and deaths for 1960 through 1966, classified on a residence basis, and provisional reports on births and deaths for 1967 and 1968 classified on an occurrence basis. All provisional figures were adjusted to a residence basis. The data on births were corrected for underregistration using factors extrapolated from the results of the 1950 Birth Registration Test conducted by the National Office of Vital Statistics (part of the National Center for Health Statistics), U.S. Public Health Service, in conjunction with the 1950 Census of Population. It was assumed that the percent completeness of birth registration in hospitals and out of hospitals has remained unchanged since 1950. Registered births in hospitals and out of hospitals were corrected separately by those factors to allow for an expected improvement in registration due to the increased concentration of births in hospitals, where registration has been more complete. In 1966, the estimated completeness of birth registration for the Nation as a whole was 98.9 percent.⁷

ACCURACY OF ESTIMATES

The technique used to develop estimates by age has been employed by the Bureau of the Census for a number of years. The estimates are considered to be fairly accurate, but they are subject to substantially larger error on the average than are estimates for the total population of States.⁸

The estimates of population 65 and over are assumed to be relatively accurate since they came directly from a reporting system covering virtually the whole universe. Those 5 to 17 are also believed to have relatively higher accuracy than those of other age groups, since the estimates of migration are based on State data relating to the specific age group (school enrollment). The assumptions made as to net interstate migration for the other age groups are so broad that small or even moderate changes by age, as indicated by the estimates, may not be very accurate. Accuracy tests made for the 1950-60 decade, however, suggest that most of the estimates reflect the true level fairly well (see footnote 8).

The estimates by age shown in this report are derived by a variation of Component Method II. The migration estimates developed by this pro-

cedure are adjusted, however, to State migration totals which are based on an average of Component Method II and the Regression method. In many cases large adjustments were necessary to bring the migration estimates by age based on national migration factors into agreement with the "better" estimates of migration implied by the published State migration totals.

A special caution is needed relative to the estimates for the District of Columbia. In general, it is believed that the age estimates presented in this report for this area are subject to substantially larger errors than those for the States. The relatively mechanical means employed for distributing migration estimates, by age, for States may be inappropriate for use in urban areas like the District of Columbia. Gross patterns of interstate migration, by age, used here are not likely to be consistent with patterns of migration exchange, by age, occurring between the central city of a metropolitan area (which the District of Columbia constitutes) and its suburbs. This may affect particularly the distribution of migrants between the District and its suburbs in the States of Maryland and Virginia for the population under 5 years of age. It was considered prudent to merge the estimates for the population in this age group for the District of Columbia with those for Maryland and Virginia. The tables in this report show only a single figure representing the three areas in combination for the age group under 5.

The age estimates for 1968 for all States are necessarily much less reliable than the comparable estimates for 1967, since they depend heavily on extrapolation of the components of change. The provisional nature of the net migration component is particularly significant, and subsequent revision of this component will have important impact on the estimates.

CONSISTENCY WITH EARLIER PUBLICATIONS

The estimates by age for July 1, 1965 to 1967 supersede estimates for those dates published last year in Series P-25, No. 384. In 1967, the revision represents mainly the substitution of estimates of net migration, by age, based on symptomatic data for the whole period 1960 to 1967 for estimates of net migration, by age, in which the last year of the period was extrapolated. Another source of difference is introduced by use of Medicare statistics as a basis for developing the population in ages 65 and over.

For 1966 and 1965, the estimates, by age, were adjusted to be consistent with revised State population totals published in Current Population Reports, Series P-25, No. 414.

⁷White 99.3 percent; nonwhite 96.9 percent.

⁸A rough evaluation of the results of this method for selected age groups for the 1950 decade is presented in: Meyer Zitter and Henry S. Shryock, Jr., "Accuracy of Methods of Preparing Postcensal Population Estimates for States and Local Areas," Demography, Vol. 1, No. 1, 1964, table 7.

Because of unusually large changes in the symptomatic data series used in these revisions, the estimates shown in this report are not fully consistent with the estimates for 1961 to 1964 published in Report No. 384.

RELATED REPORTS

The estimates of the population of States by broad age groups contained in this report are consistent with the estimates of the total population of States published in Current Population Reports, Series P-25, No. 414.

The national totals by age for the years 1965 to 1967 agree with those shown in Series P-25,

No. 385; the figures for 1968 are consistent with national population estimates by age published in No. 416.

Revised projections of the population of States by age, 1970 to 1985, are given in Series P-25, No. 375.

ROUNDING OF ESTIMATES

Estimates presented in the tables of this report have been rounded to the nearest thousand without being adjusted to group totals, which are independently rounded. Percentages are based on unrounded numbers.
