

Health Insurance Coverage

1999

Issued September 2000

P60-211

Consumer Income

Current Population Reports

By Robert J. Mills

Reversing a 12-year trend, the share of the population without health insurance declined in 1999, the first decline since 1987 when comparable health insurance statistics were first available. In 1999, 15.5 percent of the population were without health insurance coverage during the entire year, down from 16.3 percent in 1998. From 1987 to 1998, this rate either increased or was unchanged from one year to the next. Similarly, the number of people without health insurance coverage declined for the first time in 1999, to 42.6 million people, down 1.7 million from the previous year.

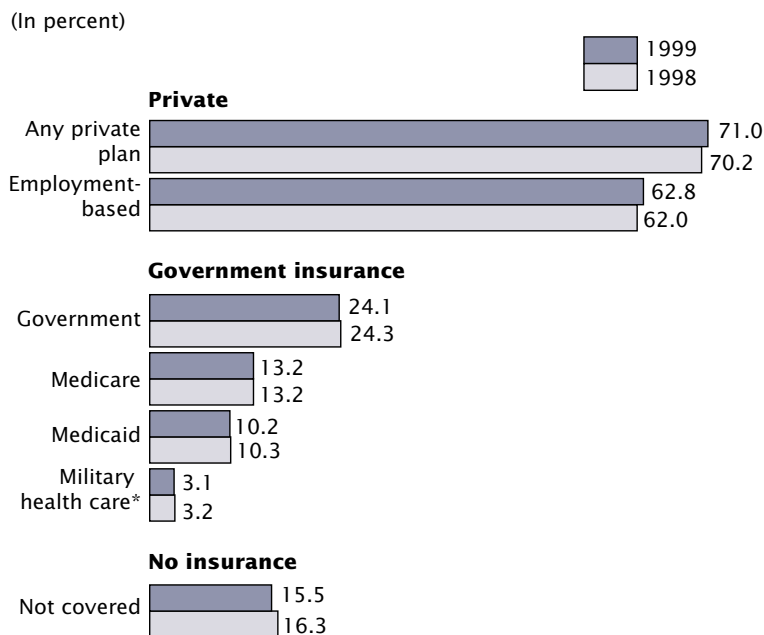

Other highlights:²

- The number and percent of people covered by employment-based health insurance rose significantly in 1999, driving the overall increase in health insurance coverage.
- Mirroring what happened for the total population, the proportion of uninsured children declined in 1999 — to 13.9 percent of children — the lowest rate since

²Confidence intervals for estimates are provided in Table A. The uncertainty in the estimates should be taken into consideration when using them.

The estimates in this report are based on the March 2000 Current Population Survey (CPS), conducted by the U.S. Census Bureau. Respondents provide answers to the survey questions to the best of their ability, but as with all surveys, the estimates may differ from the actual values.¹

Figure 1.
Type of Health Insurance and Coverage Status: 1998 and 1999
(In percent)

*Military health care includes CHAMPUS (Comprehensive Health and Medical Plan for Uniformed Services)/Tricare, CHAMPVA (Civilian Health and Medical Program of the Department of Veterans Affairs), Veterans', and military health care.

Note: The estimates by type of coverage are not mutually exclusive; people can be covered by more than one type of health insurance during the year.

¹Hispanics may be of any race.

Source: U.S. Census Bureau, Current Population Survey, March 1999 and 2000.

1995. The number of uninsured children declined to 10.0 million.

- Although medicaid insured 12.9 million poor people, 10.4 million poor people still had no health insurance in 1999, representing about one-third of the poor (32.4 percent), which was not significantly different from 1998.
- Compared with the previous year, health insurance coverage rates increased for those with household incomes of less than

\$50,000, but were unchanged for those with \$50,000 and higher household incomes.

- Hispanics (66.6 percent) were less likely than White non-Hispanics (89.0 percent) to be covered by health insurance.³ The coverage rate for Blacks in 1999 (78.8 percent) did not differ statistically from the coverage rate for Asians and Pacific Islanders (79.2 percent).

³Hispanics may be of any race.

- American Indians and Alaska Natives were less likely to have health insurance than other racial groups, based on a 3-year average (1997-1999) — 72.9 percent, compared with 78.4 percent of Blacks, 79.1 percent of Asians and Pacific Islanders, and 88.4 percent of White non-Hispanics. However, they were more likely to have insurance than were Hispanics (65.7 percent).⁴

⁴The difference in health insurance coverage rates between Blacks and Asians and Pacific Islanders was not statistically significant.

- Among the entire population 18 to 64 years old, workers (both full- and part-time) were more likely to have health insurance (82.6 percent) than nonworkers (73.5 percent), but among the poor, workers were less likely to be covered. Just over one-half, 52.5 percent, of poor workers were insured in 1999, while the rate for poor nonworkers in 1999 was 59.2 percent.
- The foreign-born population was less likely than the native population to be insured — 66.6 percent compared with 86.5 percent in 1999.
- Young adults (18 to 24 years old) were less likely than other age groups to have health insurance coverage — 71.0 percent in 1999 compared with 82.9 percent of those 25 to 64 and, reflecting widespread medicare coverage, 98.7 percent of those 65 years and over.

Employment-based insurance, the leading source of health insurance coverage, drove the increase in insurance coverage rates.⁵

Most people (62.8 percent) were covered by a health insurance plan related to employment for some or all of 1999, an increase of 0.8 percentage points over the previous year. The increase in private health insurance coverage reflects the increase in employment-based insurance; it also increased 0.8 percentage points to 71.0 percent in 1999 (see Figure 1).

The government also provides health insurance coverage, but there was no change between 1998 and 1999 in the overall government-pro-

⁵Employment-based health insurance is coverage offered through one's own employment or a relative's.

vided health insurance coverage rate. Among the entire population, 24.1 percent had government insurance, including medicare (13.2 percent), medicaid (10.2 percent), and military health care (3.1 percent). Many people carried coverage from more than one plan during the year; for example, 7.5 percent of people were covered by both private health insurance and medicare.

The poor and near poor are less likely to have health insurance than the total population.

Despite the medicaid program, 32.4 percent of the poor (10.4 million people) had no health insurance of any kind during 1999. This percentage — double the rate for the total population — did not change statistically from the previous year. The uninsured poor comprised 24.5 percent of all uninsured people.

Medicaid was the most widespread type of health insurance among the poor, with 39.9 percent (12.9 million) of those in poverty covered by medicaid for some or all of 1999. This percentage did not change statistically from the previous year.⁶

Among the near poor (those with a family income greater than the poverty level but less than 125 percent of the poverty level), 25.7 percent (3.1 million people) lacked health insurance in 1999. This percentage decreased significantly from 1998, however, when 29.9 percent of the near poor lacked health insurance. The percentage of the near poor who had private health insurance rose from 38.3 percent in 1998 to 41.7 percent in 1999. Government health insurance coverage among the near poor also increased, from 42.3 percent in 1998 to 43.9 percent in 1999.

⁶Changes in year-to-year medicaid estimates should be viewed with caution. For more information, see the Technical Note on page 12.

Key demographic factors affect health insurance coverage.

Age - People 18 to 24 years old were less likely than other age groups to have health insurance coverage during 1999. Their coverage rate (71.0 percent) rose by 1.0 percentage point from 1998. Because of medicare, most people 65 years and over (98.7 percent) had health insurance in 1999. For other age groups, health insurance coverage ranged from 76.8 percent to 86.2 percent (see Figure 2).

Among the poor, adults ages 18 to 64 had a markedly lower health insurance coverage rate (55.8 percent) in 1999 than either children (76.7 percent) or the elderly (96.6 percent).

Race and Hispanic origin - The uninsured rate declined significantly in 1999 for Hispanics and White non-Hispanics — for Hispanics, from 35.3 percent to 33.4 percent and for White non-Hispanics, from 11.9 percent to 11.0 percent.⁷ Among Blacks, the uninsured rate dropped by 1 percentage point from 22.2 percent in 1998 to 21.2 percent in 1999. The uninsured rate among Asians and Pacific Islanders did not change significantly from 1998 — 20.8 percent of Asians and Pacific Islanders were without health coverage in 1999.⁸

⁷Because Hispanics may be of any race, use caution in comparing data for Hispanics and racial groups such as Blacks (3.0 percent of whom were Hispanic in 1999) and Asians and Pacific Islanders (1.7 percent of whom were Hispanic in 1999). Furthermore, the Hispanic population consists of many distinct groups that differ in socio-economic characteristics, culture, and recency of immigration. Because of differences among the individual groups, data users should exercise caution when interpreting aggregate data for this population.

⁸The Asian and Pacific Islander population consists of many distinct groups that differ in socio-economic characteristics, culture, and recency of immigration. Because of differences among them, data users should exercise caution when interpreting aggregate data for this population.

¹Hispanics may be of any race.

Source: U.S. Census Bureau, Current Population Survey, March 1998, 1999, and 2000.

The Current Population Survey, the source of these data, samples 50,000 households nationwide and is not large enough to produce reliable annual estimates for American Indians and Alaska Natives. However, Table D displays 3-year averages of the number of American Indians and Alaska Natives and their 3-year average uninsured rate and provides 3-year average uninsured rates for the other race groups for comparison. The 3-year average (1997-1999) shows that 27.1 percent of American Indians and Alaska Natives were without coverage, compared with 21.6 percent for Blacks, 20.9 percent for Asians and Pacific Islanders, and 11.6 percent for White non-Hispanics.⁹ However, the 3-year average uninsured rate for Hispanics (34.3 percent) was higher.¹⁰

⁹Data users should exercise caution when interpreting aggregate results for American Indians and Alaska Natives (AIAN) because the AIAN population consists of groups that differ in economic characteristics. Data from the 1990 census show that economic characteristics of those American Indians and Alaska Natives who live in American Indian and Alaska native areas differ from the characteristics of those who live outside these areas. In addition, the CPS does not use separate population controls for weighting the AIAN samples to national totals. See Accuracy of Estimates on page 12 for a further discussion of CPS estimation procedures.

¹⁰The difference in health insurance coverage rates between Blacks and Asians and Pacific Islanders was not statistically significant.

Nativity - In 1999, the proportion of the foreign-born population without health insurance (33.4 percent) was more than double that of the native population (13.5 percent).¹¹ Among the foreign born, noncitizens were more than twice as likely as naturalized citizens to lack coverage — 42.6 percent compared with 17.9 percent.

Health insurance coverage rates among the foreign born increase with length of residence and citizenship. For example, while about half (53.0 percent) of noncitizen immigrants living in the United States less than 10 years had health insurance coverage, the rate rises to 91.1 percent for noncitizen immigrants living in the United States for 40 years or more. Among naturalized citizens, the comparable rates were 69.5 percent and 96.4 percent.

Educational attainment - Among adults, the likelihood of being insured increased as the level of education rose. Among those who were poor in 1999, there were no

¹¹Natives are people born in the United States, Puerto Rico, or an outlying area of the United States, such as Guam or the U.S. Virgin Islands, and people who were born in a foreign country but who had at least one parent who was a U.S. citizen. All other people born outside the United States are foreign born.

differences in health insurance coverage rates across the education groups.

Economic status affects health insurance coverage.

Income - The likelihood of being covered by health insurance rises with income. Among households with annual incomes of less than \$25,000, the percentage with health insurance was 75.9 percent; the level rises to 91.7 percent for those with incomes of \$75,000 or more (see Figure 2).

Compared with the previous year, coverage rates increased for those with household incomes of less than \$50,000, but were unchanged for those with \$50,000 or higher household incomes. For those with household incomes of less than \$25,000, the coverage rate increased 1.1 percentage points to 75.9 percent, whereas for those with incomes between \$25,000 and \$50,000, it increased 0.6 percentage points to 81.9 percent in 1999.¹²

¹²The difference in the increases for those with incomes of less than \$25,000 and those with incomes between \$25,000 and \$50,000 was not statistically significant.

Work experience - Of those 18 to 64 years old in 1999, full-time workers were more likely to be covered by health insurance (83.6 percent) than part-time workers (77.6 percent), and part-time workers were more likely to be insured than nonworkers (73.8 percent).¹³ However, among the poor, nonworkers (59.2 percent) were more likely to be insured than workers (52.5 percent). Poor full-time workers did not fare better than poor part-time workers — 52.5 percent and 52.7 percent, respectively.

Firm size - Of the 139.2 million workers in the United States (18-64 years old), 55.5 percent had employment-based health insurance policies in their own name (see Figure 3). The proportion generally increased with the size of the employing firm — 30.6 percent of workers employed by firms with fewer than 25 employees and 68.3 percent for workers employed by firms with 1000 or more employees, for example. (These estimates do not reflect the fact that some workers were covered by another family member's employment-based policy).

The uninsured rate for children decreased between 1998 and 1999.

The percentage of children (people under 18 years old) without health insurance in the United States dropped from 15.4 percent in 1998 to 13.9 percent in 1999. The increase in employment-based insurance accounted for most of the change; no change occurred in government health insurance coverage.

Among poor children, the uninsured rate also fell, from 25.2 percent in 1998 to 23.3 percent in 1999. An increase in government health insurance coverage accounted for most of

this drop; no change occurred in employment-based coverage. Poor children made up 28.2 percent of all uninsured children in 1999.

Among near-poor children (children in families with incomes greater

than the poverty level but less than 125 percent of the poverty level), the proportion without health insurance fell substantially from 27.2 percent in 1998 to 19.7 percent in 1999. Increases in both government health insurance

coverage (from 40.6 percent to 43.8 percent) and private health insurance coverage (from 38.3 percent to 44.8 percent) accounted for the change. The State Children's Health Insurance Program, which expanded access to health coverage for low-income children under age 19, likely contributed substantially to the increase in government coverage.¹⁴

Children's characteristics affect their likelihood of health insurance coverage.

- Children 12 to 17 years of age were more likely to be uninsured than those under 12 — 14.4 percent compared with 13.6 percent.
- For Hispanic children and for White non-Hispanic children, the uninsured rate declined significantly in 1999 — from 30.0 percent to 27.2 percent for Hispanic

¹⁴In contrast, children are defined by the Census Bureau to be under 18 years of age.

children and from 10.6 percent to 8.9 percent for White non-Hispanic children. For Black children, the uninsured rate declined from 19.7 percent to 17.9 percent, whereas 16.7 percent of Asian and Pacific Islander children were uninsured in 1999, statistically unchanged from 1998 (see Figure 4).

- While most children (68.9 percent) were covered by an employment-based or privately purchased health insurance plan in 1999, one in five (20.0 percent) were covered by Medicaid (see Figure 5).
- Black children had a higher rate of Medicaid coverage in 1999 than children of any other racial or ethnic group — 36.2 percent, compared with 30.8 percent of Hispanic children, 16.7 percent of Asian and Pacific Islander children, and 13.2 percent of White non-Hispanic children (see Figure 6).

- Children living in single-parent families in 1999 were less likely to be insured than children living in married-couple families — 81.8 percent compared to 88.4 percent.

Some states had higher uninsured rates than others.

The proportion of people without health insurance ranged from 8.8 percent in Minnesota to 24.1 percent in Texas, based on 3-year averages for 1997, 1998, and 1999 (see Table E). The Census Bureau does not recommend that these estimates be used to rank the states, however. For example, the uninsured rate for Texas was not statistically different from that in Arizona, while the rate for Minnesota was not statistically different from Rhode Island or Hawaii, as shown in Figure 7.

Comparisons of 2-year moving averages (1997-1998 and 1998-1999) show that the proportion of people

Figure 7.

Percent of People Without Health Insurance Coverage Throughout the Year by State, 3-year Average: 1997 to 1999

Source: U.S. Bureau of the Census, Current Population Survey, March 1998, 1999, and 2000.

without coverage fell in 15 states: Arizona, Arkansas, California, Connecticut, Iowa, Maine, Massachusetts, Mississippi, Missouri, New Jersey, New York, North Dakota, Rhode Island, Tennessee, and Texas. Meanwhile, the proportion of people without coverage rose in eight states: Hawaii, Illinois, Louisiana, Nevada, New Mexico, Vermont, Washington, and Wisconsin.

Accuracy of the Estimates

Statistics from surveys are subject to sampling and nonsampling error. All comparisons presented in this report take sampling error into account and meet the Census Bureau's standards for statistical significance. Nonsampling errors in surveys may be attributed to a variety of sources, such as how the survey was designed, how respondents interpret questions, how able and willing respondents are to provide correct answers, and how accurately answers are coded and classified. The Census Bureau employs quality control procedures throughout the production process – including the overall design of surveys, the wording of questions, review of the work of interviewers and coders, and statistical review of reports.

The Current Population Survey employs ratio estimation, whereby sample estimates are adjusted to independent estimates of the national population by age, race, sex, and Hispanic origin. This weighting partially corrects for bias due to undercoverage, but how it affects different variables in the survey is not precisely known. Moreover, biases may also be present when people who are missed in the survey differ from those interviewed in ways other than the categories used in weighting (age, race, sex, and Hispanic origin). All

of these considerations affect comparisons across different surveys or data sources.

For further information on statistical standards and the computation and use of standard errors, contact Jeffrey Stratton of the Demographic Statistical Methods Division on the Internet at dsmd_s&a@census.gov.

Technical Note

This report presents data on the health insurance coverage of people in the United States during the 1999 calendar year. The data, which are shown by selected demographic and socioeconomic characteristics, as well as by state, were collected in the March 2000 Supplement to the Current Population Survey (CPS).

Treatment of major federal health insurance programs

The Current Population Survey (CPS) underreports medicare and medicaid coverage compared with enrollment and participation data from the Health Care Financing Administration (HCFA).¹⁵ A major reason for the lower CPS estimates is that the CPS is not designed primarily to collect health insurance data; instead, it is largely a labor force survey. Consequently, interviewers receive less training on health insurance concepts. Additionally, many people may not be aware that they or their children are covered by a health insurance program and therefore fail to report coverage. HCFA data, on the other hand, represent the actual number of people who enrolled or participated in these programs and are a more accurate source of coverage levels.

¹⁵HCFA is the federal agency primarily responsible for administering the medicare and medicaid programs at the national level.

Changes in medicaid coverage estimates from one year to the next should be viewed with caution. Because many people who are covered by medicaid do not report that coverage, the Census Bureau assigns coverage to those who are generally regarded as “categorically eligible” (those who received some other benefits, usually public assistance payments, that make them eligible for medicaid). Since the number of people receiving public assistance has been dropping, the relationship between medicaid and public assistance has changed, so that the imputation process has introduced a downward bias in the most recent medicaid estimates.

Beginning with the publication of the 1997 Health Insurance Coverage report, the Census Bureau modified the definition of the population without health insurance in the Current Population Survey, as a result of consultation with health insurance experts. Previously, people with no coverage other than access to Indian Health Service were counted as part of the insured population. Beginning with the 1997 Health Insurance Coverage report, however, the Census Bureau counts these people as uninsured. The effect of this change on the overall estimates of health insurance coverage is negligible.

CPS sample expansion

Currently, March CPS interviews approximately 50,000 households across the country. One of its many uses is to allocate funds to states under the federal government's State Children's Health Insurance Program (SCHIP).¹⁶ Congress has appropriated additional funds to

¹⁶Data on low income uninsured children by state using the SCHIP allocation formula are available electronically on the Census Bureau's poverty website at <http://www.census.gov> or directly at <http://www.census.gov/hhes/hlthins/lowinckid.html>.

the Census Bureau to expand the CPS sample size and thus produce more reliable state estimates of the number of low-income children without health insurance (which are used in the SCHIP allocation formula). Although the legislation is specifically targeted toward producing better estimates of children's health insurance coverage at the state level, other state estimates from the March CPS will also improve. The expansion, which will be fully in effect in 2001, will roughly double the number of interviewed households in the March CPS. This doubling will be accomplished by increasing the monthly CPS sample and by administering the March supplement to additional households in February and April.

The Census Bureau plans to use data from the March 2001 CPS to evaluate the effect of the expansion on estimates from the survey. Official estimates from the March 2001 CPS, which will be released in September 2001, will be based on the original sample before the expansion. Release of data from the expanded sample will be delayed until the end of 2001, so that analysts can examine them thoroughly. If no problems are found (none are expected), the new sample cases will be fully integrated into the estimates released from the March 2002 CPS.

The Census Bureau is still working out the final details of the CPS sample expansion. A more detailed description of the expansion will be posted on the CPS Web site

(<http://www.bls.census.gov/cps/cpsmain.htm>) before the end of 2000. In the meantime, comments or suggestions should be sent to Charles Nelson, Assistant Chief, Housing and Household Economic Statistics Division, U.S. Census Bureau, by mail to Room 1071-3, Washington, DC 20233-8500, or by e-mail to charles.t.nelson@census.gov.

¹Includes CHAMPUS (Comprehensive Health and Medical Plan for Uniformed Services)/Tricare, Veterans', and military health care. ²Beginning with the March 1998 CPS, people with no coverage other than access to Indian Health Service are no longer considered covered by health insurance; instead, they are considered to be uninsured. The effect of this change on the overall estimates of health insurance coverage is negligible; however, the decrease in the number of people covered by Medicaid may be partially due to this change. ³Health insurance questions were redesigned. Increases in estimates of employment-based and military health care coverage may be partially due to questionnaire changes. Over-all coverage estimates were not affected. ⁴Data collection method changed from paper and pencil to computer-assisted interviewing. ⁵Implementation of 1990 census population controls. ⁶Implementation of a new March CPS processing system.
