

Here's What's New in Louisiana Truck Trends

Data from the Census Bureau's 1997 Vehicle Inventory and Use Survey are now available for Louisiana. This survey produces state and U.S. level statistics on the physical and operational characteristics of the Nation's truck, van, minivan, and sport utility vehicle population.

There were an estimated 1,210,100 private and commercial trucks registered in Louisiana during 1997, up more than 7 percent from the approximately 1,123,800 trucks registered in 1992.

The survey includes these highlights for Louisiana:

The number of minivans registered in Louisiana during 1997 increased 58.3 percent from 1992. In comparison, the number of sport utility vehicles (SUVs) increased 42.6 percent from 1992 and the number of pickups decreased 0.7 percent during this same period.

- Total truck registrations in 1997 included 60.7 percent pickups, 12.3 percent SUVs, and 12.1 percent minivans.
- Louisiana has about one pickup for every 6 people, and about one SUV for every 29 people. It also has about one pickup for every 4 licensed drivers and one SUV for every 18 licensed drivers.
- Approximately 9.0 percent of all large trucks carried hazardous materials in 1997.

- About 69.9 percent of all trucks were used for personal transportation, while 26.4 percent were operated for business, including for-hire use.
- Approximately 1.9 percent of all large trucks were leased from someone else, compared with 1.4 percent in 1992.

The report also includes information on fuel efficiency, annual and lifetime mileage, model year, equipment accessories and other data for each kind of registered truck.

The U.S. Summary will be issued in late 1999, following the release of reports for the 50 states and the District of Columbia. This survey is conducted every five years as part of the Economic Census and data are used by government agencies, business, industry, academia, and the general public.

The estimates from the 1997 Vehicle Inventory and Use Survey are subject to sampling and nonsampling error. Sources of nonsampling error include errors of response, non-reporting and coverage. Measures of sampling variability, presented as relative standard errors, are shown in the tables in the report.
