Frequently Asked Questions (FAQs)
COVID-19’s Effect on the Quarterly Services Report

**Data Collection**

**How has the collection of Quarterly Services Survey data been affected?**

Processing and data quality were monitored throughout the quarter. Quality metrics, such as response rate standards for publication, were continuously monitored and evaluated throughout the data collection period for the published industries.

**Methodology**

**Were there any estimates withheld or delayed because of data collection problems?**

No. Estimates were released as scheduled. As part of the Census Bureau’s methodological process, some estimates may be suppressed if they do not meet pre-existing publication standards.

**Did the Census Bureau modify its usual weighting or estimation methods used to produce quarterly services estimates for the current quarter?**

No. Standard weighting and estimation methods were used to produce all indicator estimates for the current quarter.

**Did the Census Bureau do anything differently this quarter with data collected from fiscal reporters?**

No. Data received from fiscal reporters was evaluated in a similar manner as is done in each quarter’s processing. Since not all companies maintain their quarterly records on a calendar quarter, the Census Bureau accepts, evaluates, and uses the fiscal quarter data as part of the QSS collection unless it determines that the reported data are not representative of the calendar quarter.

**How did the Census Bureau treat companies that reported zero or negative revenue this quarter?**

The Census Bureau did not change its treatment of zero or negative revenue reporting for this quarter. The Quarterly Services Survey collects gross revenue. If a company’s gross revenue is zero or negative, the Census Bureau accepts, evaluates, and uses the reported data, unless it determines that the reported data is not generally reflective of companies represented by that sampling unit.

**Has the reliability of the quarterly services estimates changed?**

No. The reliability of the services estimates, as measured by the coefficient of variation for quarterly totals and the standard error for quarter-to-quarter change, has not changed substantially. For the published industries, reported data for the current quarter exhibited variation similar to that for prior quarters.
**Seasonal Adjustment**

Did the Census Bureau alter the procedures for developing the seasonally adjusted estimates for selected services data?

Yes. An alteration was made in an option in the Census Bureau’s X-13ARIMA-SEATS seasonal adjustment software (the “additive outlier adjustment” option) for the current quarter for some kinds of business. This was done in an effort to ensure that the published seasonally adjusted values fully include any immediate effects. These effects are not typical for the current quarter and so should not be permitted to influence the seasonal factors for the current and surrounding quarters. The altered option was applied to each kind of business whose current unadjusted value was found to be statistically untypical, as indicated by the appropriate t-statistic having a magnitude larger than a commonly used “critical value,” and for which there were independent indications of an impact. Such indications confirm that the current quarter survey value has an unusual potential to be untypical and justify the use of a standard critical value. In a usual quarter, every survey value is “blindly” tested, therefore a higher critical value is used, making it more difficult for the survey value to be classified as untypical.

What was the impact of altering the seasonal adjustment option (additive outlier adjustment) for the current quarter?

For the kinds of business that were impacted, if the current quarter value had been treated as typical, the program would have taken part of the impact to be a seasonal effect and would have adjusted the data in a way that would have brought the adjusted percent change from the prior quarter to the current quarter closer to zero. The altered option we used determined the impact to these kinds of business to be out of the ordinary. As a result, the prior quarter to current quarter percent change in the adjusted values was left further from zero.

How was the survey value for a kind of business determined to be out of the ordinary?

Each quarter, independent indications of how each kind of business performed are researched as part of our normal review of the estimates to detect reporting errors. This research includes, but is not restricted to, conversations with companies in our survey, a review of publicly available press releases from both companies and industry associations, and a review of other economic indicators.

This quarter, the value of a kind of business was considered to be out of the ordinary if it was found to be statistically untypical (as indicated by the appropriate t-statistic having a magnitude larger than a “standard” critical value) and independent sources indicated an impact.
Additional Information

Are there additional Census Bureau resources available on the COVID-19 Pandemic?

Yes. The Census Bureau has created a COVID-19 reference page which includes links to relevant Census data sources.
